Author's Declaration

I, the undersigned Rick Slootweg, hereby declare that I am the sole author of this thesis. To the best of my knowledge this thesis contains no material previously published by any other person except where due acknowledgement has been made. This thesis contains no material which has been accepted as part of the requirements of any other academic degree or non-degree program, in English or in any other language. This is a true copy of the thesis, including final revisions.

Date: 02/06/2022

Name (printed letters): Rick Slootweg

Signature:

A handwritten signature in black ink, appearing to read "R. Slootweg".

Abstract

This thesis investigates to what extent economic relations impact the newsworthiness of foreign human rights abuses through a content analysis of six Belgian and Dutch newspapers on Uyghur repression between 2015 and 2021. Given that the Netherlands has significantly stronger economic ties with China than Belgium has in terms of trade and FDI, we expect that Dutch media are more interested Uyghur related stories than Belgian media. The findings indeed show that Dutch news coverage exceeded Belgian news coverage, that it was featured more prominently in newspapers, and that coverage was more sustained between 2015 and 2021. A significant share of Belgian news coverage was driven by either domestic developments or involvement by international actors like the EU or the UN, implying that Belgian news coverage of the Uyghur genocide is not determined by the extent of the human rights abuses but rather by the involvement of domestic actors and the international community. Furthermore, we show that Dutch newspapers published references to genocide both earlier and to a greater extent than its Belgian counterparts. These findings thus confirm that economic ties drive media's interest and awareness of partners' controversial issues such as human rights abuses.

Acknowledgements

I want to thank my supervisor, Dr. Robert Sata, for his guidance and invaluable advice throughout the thesis process. I also want to express my gratitude to my friends and CEU peers with whom I have had the privilege to study. Lastly, I want to thank my mother, my father and my brother for their support in the last two years.

1. Introduction

The Uyghur population in the Chinese province of Xinjiang has been subjected to extreme levels of repression in the last decades, ranging from surveillance to disappearances and mass detainment. These human rights abuses have reached the extent that scholars and political leaders have increasingly started to classify this situation as a cultural genocide (Smith Finley, 2021). While several countries such as the United States and the United Kingdom have officially adopted the term genocide, others have been silent or have, in extreme cases even aided the Chinese government by sending back Uyghur refugees to China (Lavi & Lindenstrauss, 2016). This discrepancy in response can also be seen by the stark differences in the extent of media coverage regarding this issue across the world. For instance, while some western news outlets such as the BBC and CNN have produced many reports on mistreatment of Uyghurs in Xinjiang (CNN, 2021; BBC-A,2021), Ezell (2021) notes how in the last decades there have been relatively few articles dedicated to Uyghur issues in media in the Middle East. The question arises why this discrepancy is the case. Why are some very vocal on this topic and others silent?

This question is part of a broader inquiry of what determines the extent and variation of foreign news coverage on human rights abuses. Which foreign events reach the news and get published is based on several factors that make up the news value of a story. Multiple studies (Maier, 2021; Shoemaker, Danielian & Brendlinger, 1991; & Wu, 2000) have found that economic interaction, such as trade, was one of the most important determinants of a country being followed by the media, followed by cultural and geographic proximity and nation traits (GDP and population size). Human rights issues existing in the country are by themselves

weak predictors of foreign news reporting (Maier, 2021), and predominantly become news only in combination with other factors.

The rise of China over the last decades has increased its prominence in the international press. However, Zhang & Brown (2009) show that in the case of western media, human rights coverage does not reflect the human rights situation in China and they argue that these topics are systematically under-reported in favor of economic and business news stories. This is argued to be the case due to the fact that news value of economic events is considered higher than the news value of human rights topics. However, despite the lesser extent of coverage on human rights abuses, Willnat & Leo (2011) found that in terms of content, China was consistently portrayed by western media with frames focusing on human rights, besides political containment, and economic trade. This appears to support the idea of the domestication of foreign news, in which foreign news is linked to domestic issues or contextualized from a domestic perspective, resulting in the properties of the country involved to become less important (Chang et al. 2012).

Furthermore, it has been argued that media is embedded in larger political and economic structures and thus tend to reflect the political and economic interests of their country (Lee, Chan & Zhou, 2011). The available research on the issue seem to indicate that economic interests and relations have an impact on foreign coverage of human rights issues, such as Lee & Yang's (1996) observation of US and Japanese international news coverage on the Tiananmen Square protest being framed in line of their respective government's strategic interests. The strongest evidence is provided by Lee et al. (2011) who found a negative correlation between the amount of politicized news on the Beijing Olympics that mentioned China's human rights issues, and the country's trade volume with China. Yet, this study included countries with varying degrees of press freedom, as it also found that liberal countries featured more of these articles than less liberal countries. The question therefore remains

whether this negative relationship holds across countries with a high degree of press freedom, as in a competitive free press environment, the media and government will often have competing agendas and responsibilities. (Novais, 2007).

In light of the above, this thesis aims to answer the question whether economic relations impact the extent and content of European news reporting on foreign human rights violations. It specifically focuses on the Uyghur genocide given the severity and scale of the event and as well as the fact that it has been an ongoing event since the mid 2010's. This research is conducted using a content analysis of news articles from several newspapers in the Netherlands and Belgium between 2015 and 2021. The choice of these two countries is based on their vastly varying extent of Chinese economic relations in terms of trade and FDI on the one hand, and their similarities across a multitude of factors such as their media system, geographical proximity, and foreign policy on the other. With this thesis, the author hopes to further the understanding of human rights reporting in western media.

2. Literature Review

2.1 The Uyghur Minority in Xinjiang: From Conflict and Repression to Cultural Genocide

The resource-rich province of Xinjiang has been gradually incorporated by the Chinese Empire since the 17th century, becoming an official province in 1884 (Smith Finley, 2021). The province is home to the Uyghur minority who, as opposed to the Han Chinese, are predominantly Muslim and speak a Turkic language. The region has had a secessionist past, with an attempted breakaway from China in 1945 by declaring the short-lived East Turkestan Republic (Finnegan, 2020). The Chinese Communist Party (CCP) subsequently adopted assimilationist policies in the 1950's in an attempt to integrate the province and assimilate ethnic minorities (Ibid). In 1955, Xinjiang changed status from a province to an autonomous region and was renamed the Xinjiang Uygur Autonomous Region (XUAR). Unrest amongst the Uyghur population has been a recurring theme from the 1980's onwards and was attributed to religious and cultural differences as well as the discrepancy in socio-economic conditions between the natives and the Han-settlers. (Smith Finley, 2021). Furthermore, the wave of newly created states in central Asia after the collapse of the Soviet Union made the Uyghurs in Xinjiang the only “nation” in the region that was still under control of a colonizing state (ibid).

Tensions escalated in the 1990's in the wake of the “Baren incident”. Accounts on what exactly happened varied, but it is known that it was an armed conflict between several hundred of Uyghurs and Chinese government forces in the Barin Township which lasted several days. The resulting violence and clashes between Uyghurs and the police and led to the increased framing of Uyghur unrest as terrorism and subsequent tightening controls on religion in the region (ibid). The trend of post-9/11 Islamic terrorism discourse has been argued to have been used as a justification of the CCP's repressive “strike hard” policies, as it argued that “illegal

religious activities” associated with the Uyghur minority constituted the roots of terrorism (Finnegan, 2020). This has led to state violence and a securitization of Uyghur social life, involving raids on Uyghur homes (Smith Finley, 2021). Policies of repression culminated in the new National Security Law, passed in 2015, which highlighted internal threats to state security. Alongside this law, a counter-terrorism law was implemented which specifically targeted the Uyghur population (*Ibid*).

In 2017, Chinese authorities in the region published the Xinjiang Autonomous Region Regulation on De-extremification, which mandated the creation of “transformation through reeducation” camps (later termed vocational training centers) which has facilitated the mass extra-judicial internment of Uyghurs in the region. In the same year, 21% of all arrests made in the country occurred in the XUAR, despite only consisting of 1,5% of the total population of China (Kanat, 2021). The number of detainees has been estimated to exceed a million (Raza, 2019), and harrowing reports of torture, rape and malnutrition have been published by a multitude of organizations (Amnesty, 2021 & CFR, 2021). Life outside of these camps has also drastically changed, with Chinese efforts to eliminate Uyghur culture, including its language, which has been virtually eliminated from schools. Kanat (2021) notes that Uyghur cultural practices have only become permitted in narrowly defined and tightly controlled situations, for either propaganda efforts or tourism. Outside of these situations however, repression goes as far as banning headscarves and beards. The author also mentions findings that suggest that nearly 65% of all mosques in the XUAR were either completely destroyed or damaged (*ibid*).

Even more alarming, it has been argued that the CCP under the leadership of Xi Jinping has instituted a policy of suppressing birthrates of Uyghurs by forced sterilization, family separation and mandatory birth control (Zenz, 2020). Smith Finley (2021) provides data that the city of Khotän in Xinjiang budgeted for enough sterilizations to cover more of a third of all women of childrearing age. All policies have had an effect on birthrates, in some areas falling

as much as 60% between 2016 and 2018 while the birthrate in the province as a whole fell by 25% in 2019 alone (*ibid*). Furthermore, there is evidence that children were forcibly separated from their parents and sent to boarding schools (Zenz, 2019).

The suppression of Uyghur birthrates and culture (including language and religion) has led to calls condemning the situation as a genocide. Whereas some use more cautious wording such as a cultural genocide or a “creeping” genocide, it appears clear that at least some of the five criteria outlined the UN Convention on the Prevention and Punishment of the Crime of Genocide are applicable to China’s policies towards the Uyghurs, as Smith Finley (2021) shows. Besides policies aimed at preventing births (art.2 d.), the surveillance policies and extremely repressive regime in combination with the mass incarceration can be argued to fall under both article 2. b) and c), namely causing bodily and mental harm to the group and inflicting conditions of life on the group with the goal to bring about, in full or in part, its physical destruction (United Nations, 1948).

2.1.1 International Response

International concern on the human rights situation of the Uyghurs in the XUAR has existed since the early 2000’s, but the situation has only garnered greater attention in the mid-2010’s. As was mentioned earlier, the aftermath of 9/11 has led to a discourse and fear of Islamic terrorism in the world which has been used by Chinese authorities to justify repressive measures on the population. Having quickly voiced support for President Bush’s “war on terror”, it sought to frame autonomy movements in the region as terrorist movements threatening the security of China as well as neighboring countries. Already in 2004, a report by Amnesty International concluded that September 11 has had detrimental effects on the human rights situation in the province and shows Chinese efforts to pressure foreign states to take actions against the Uyghur diaspora (Amnesty, 2004).

The Chinese government's pressure on other countries to extradite Uyghurs has been successful to some degree, even after the human rights reports were public as countries such as Thailand, Egypt and Saudi Arabia have reportedly sent back many to China. Germany is also known to have deported a Uyghur refugee to China in 2006 (UHPR, 2011. p.31). However, the new XUAR security law in 2017 and the subsequent mass incarceration of Uyghurs in detention centers has led European states to reconsider their refugee status, and they have been protected from deportation in numerous countries, including Germany, since.

Increased awareness of the situation in Xinjiang following the 2017 security law has also prompted policy makers to address the concern of forced labor. A report from the Australia Strategic Policy Institute (ASPI) has found that Uyghurs have been deported directly from detention camps to factories across China under conditions which has been argued to amount to slavery. This is only strengthened by the fact that XUAR officials were paid a price "per head" to "sell" Uyghurs to these factories. In total, it claimed that 82 well-known brands, such as Apple, Nike, Mercedes-Benz and Calvin Klein have possibly directly or indirectly benefitted from Uyghur forced labor across their supply chain (ASPI, 2020). As a response to these widely shared reports, the European Union and several states such as Australia, the UK and the US, have adopted resolutions and measures aiming to prevent their businesses' possible complicity with forced labor goods and have implemented sanctions on XUAR officials and certain suppliers (UHRP,2022).

In 2021, several parliaments, including the Dutch, Czech, Canadian and UK legislative bodies, officially recognized and classified the policies against the Uyghurs in Xinjiang a genocide. In the same year, the EU implemented the first EU sanctions on China since 1989, aimed at four XUAR officials who were believed to be involved with Uyghur human rights violations. The United States has also taken action against companies involved in this matter, such as the company Hikvision which facilitates the monitoring and surveillance of Uyghurs

in Xinjiang. Lawmakers have also been attempting to bring this matter to the international arena, as more than sixty MPs from 18 different countries have called upon the UN to launch a commission of inquiry regarding genocide and crimes against humanity in the Xinjiang region (UHRP, 2022).

However, many organizations have argued that the international response has been weak and ineffective overall. Whereas many states have issued condemnations, many have not implemented effective measures or sanctions, instead limiting their actions to symbolic gestures and measures (Baillie & Vandenbrink, 2020). Gallagher (2021) argues that countries should shift the narrative away from counterterrorism towards genocide and posits that “naming and shaming” the Chinese government, especially in the run up to the Beijing Olympics in 2022 could have been an effective tool, but also warned for a backlash.

In the United States, the Biden Administration has designated Uyghurs as a top priority for refugee resettlement, although reports have shown that no Uyghur refugees were admitted to the country in 2020 and 2021 (Aguilera, 2021). Furthermore, it appears that China will not be held accountable to internal law on the matter, as the accusations of genocide will not be investigated by the International Criminal Court (Hernández, 2021). The United Nations, having promised in 2021 that it would release a report on the human rights situation in the XUAR within matter of weeks, has been silent on it ever since, fueling accusations that China has been pressuring the UN not to release the report (Page, 2022). Some have placed hope in civil society and the international media, such as Waller & Albornoz (2021), who argue that they play a crucial role as catalysts in the international community which is, despite countries’ available methods at their disposal, unwilling to provide a meaningful response to these human rights abuses.

2.2 Economic Relations Between China and the World

The post-Maoist economic reforms that started in 1978 under Deng Xiaoping gradually transformed the country from a Soviet-style command economy to a system that has been termed “Socialism with Chinese characteristics”. In the first two decades, policies were implemented to allow foreign investment to enter the country, de-collectivize the agricultural industry and create the possibility for entrepreneurs to start a business. However, most enterprises were still state owned, despite some experiments with autonomous decision making on production, investment, and marketing matters. Only in the late 1990’s did the government give up control of small and medium state enterprises, while retaining control of the large state-owned enterprises in the energy and infrastructure sectors (Chow, 2004). These economic policies have been extremely successful, having created unprecedented growth of about 10% per year on average between 1978 and 2011 (Haltmaier, 2013), and has lifted about 600 million people out of poverty and has subsequently turned China into an upper middle-income country (Lin, 2013). They have become a leading manufacturer of goods, accounting for 28,4% of the total global manufacturing output in 2018 (Richter, 2020). This has been partially explained as a result of the shift from a heavy industry-oriented economy to that of a comparative advantage one, which favored labour intensive goods (Yue & Hua, 2002). This in turn rested on the political stability, the abundance of natural resources and the large skilled labour force in China (Sun & Heshmati, 2010).

These developments have also had an impact on trade. Their growth in international trade averaged at 16,6% per year and China’s trade dependence ratio (trade to GDP ratio) went up from 9% in 1978 to 50% in 2012 (Ibid). Sun & Heshmati (2010) show that international trade has been crucial in the success of the economy, allowing for the improvement of productivity in domestic industries and the advancement of technology. Imports have substantially increased, from \$18 billion in 1978 to \$1.9 trillion in 2013, and are currently

primarily coming from the European Union, ASEAN countries and South Korea (Morrison, 2014). By 2009, China had taken over Germany as the world's largest exporter of merchandise and the US as the second-largest merchandise importer (*ibid*). Exports have increased from \$14 billion in 1978 to \$2.2 trillion in 2013, and the primary destinations are Hong Kong, the US, and the European Union. The World Bank has estimated that China's share of global merchandise exports could reach as high as 20% by 2030 (*ibid*). However, concerns have been voiced of the over-reliance on exports (and related investments) as the main drivers of economic growth instead of consumption demand, and although the latter is increasing, it is still argued that China has some time to go before it can achieve a balanced economy (Wolf, 2018).

Furthermore, there have been discussions in the West on the negative consequences of Chinese imports, in particular the large US trade deficit, which has also seen as a partial reason for a trade war between the US and China. Whereas the Trump Administration pursued trade protectionism that led to conflicts with other countries such as Canada and Mexico, it took an exceptionally harsh stance towards China, directly setting high tariffs on Chinese goods (Park, 2020). However, these tensions are seen by many as not just caused by the supposed job loss of the US-China trade deficit but as a result of the larger geopolitical conflict between the two countries (Chen et al. 2020). Nevertheless, this trade war did not appear to have had a significant effect on the volume of trade between China and the European Union, as both imports and exports increased according to Eurostat data (Eurostat, 2022). Imports appear to have grown more substantially than exports, with almost a 47% increase between 2015 and 2022, and has subsequently increased Europe's trade deficit with China by 50% in the same period, to a balance of - € 248.9 bn. The largest EU importer of Chinese goods is the Netherlands, having imported €110 bn. of Chinese goods in 2021 which accounted for nearly

30% of all Dutch extra-EU imports (*ibid*). It was also the third largest EU exporter to China in 2021 (€15 bn), followed by France (€24 bn) and Germany (€104 bn).

In terms of goods, machinery & vehicles, chemicals, and other manufactured goods, appear to be the most traded between China and the EU in terms of both imports and exports, although the EU has a trade deficit in all three categories. Specifically, the largest deficits concerned telecom, ADP (Automatic data processing) and household equipment. On the opposite side, the EU does have a large trade surplus in aircraft equipment and medicaments (*ibid*). However, the COVID pandemic has exposed numerous dependencies on China, and in total 103 product categories have been identified in which the EU has a strategic dependency on Chinese imports, mainly in the in the chemicals, minerals/metals, and pharmaceutical sectors (Zenglein, 2020).

Besides trade and manufacturing, Chinese investments abroad and foreign investment in China have increased substantially since 1978. (Si, 2014). Having rapidly developed primarily from receiving foreign investment, outward Foreign Direct Investment (FDI) began to grow as GDP increased (Wang et al. 2012). Nevertheless, China remains the second largest receiver of FDI as well (Wang et al. 2020). Chinese outward FDI has peaked in 2016, and has seen a steady decline since, in line with the reduction in Chinese investments in Europe, which has declined to 2013 levels in 2019 (Kratz et al. 2020). This decline is attributed to measures introduced in 2016 which stepped up capital controls, effectively restricting overseas use of the RMB, but also the fact that host countries have increased regulatory scrutiny (Hanemann et al. 2019). Looking at the regional distribution of Chinese outward FDI in 2016, the vast majority is directed towards Asia (67%), primarily consisting of Hong Kong (57,5%). The second largest region is Latin America (15%) followed by Europe (6,4%) and North America (5,6%) (Wang & Gao, 2018 p.626). According to Völgyi, & Lukács (2021), the large share of FDI

going to Hong Kong can be explained by offshoring and round tripping activities which will redirect its investments to a third country.

Chinese outward FDI in Europe has traditionally focused on the “big three” (UK, Germany and France), with nearly 36% of the total FDI going to them. In contrast, Chinese FDI in the whole CEE did not exceed 2,5% in 2019 (Kratz et al. 2020). While there has been a period of increased investment in Southern Europe, Chinese FDI currently still focusses on Europe’s largest economies. Furthermore, in terms of the investor mix, the relative share of state-owned enterprises and the sovereign wealth fund has increased dramatically in relation to private investors, moving from 39% to 68% between 2016 and 2017 (Hanemann et al, 2018). Chinese outward FDI has primarily entailed greenfield (creation of subsidiary in host country and building it from the ground up) and joint venture investments, although mergers and acquisitions (brownfield investments) have been on the rise (Globerman & Shapiro, 2009). This can in part explain the growing concern over Chinese FDI in Europe and the US, given that brownfield investment is associated with little economic benefits in terms of job creation. It also allows the investing country to absorb technology from acquired companies and it can create worries over national security and the control of strategic industries (Chan & Zheng, 2017). Furthermore, Ebbers and Zhang (2010) show that brownfield investments have become the main Chinese investment type in Europe. Hanemann et al. (2018) estimate that 96% of Chinese FDI in Europe currently consists of acquisitions.

It has been noted that China has been making efforts to shift their focus to producing high-value-added goods with the in 2015 launched “made in China 2025” plan (Jindřichovská & Uğurlu, 2021). This has been seen as part of a wider idea termed “the Chinese dream”, which aims to greatly increase economic development and encompasses other large-scale plans such as the Belt & Road Initiative (Agarwala & Chaudhary, 2021). However, many have highlighted the challenges China faces, not only from the US and its allies, as these plans are seen to

challenge the status-quo (*ibid*), but also due to the domestic problems they face such as ageing, environmental degradation, and corruption (Kalha, 2015). Liu (2021) has highlighted the issues in the wake of the COVID pandemic, such as industrial overcapacity, rising leverage across all sectors and an inflating real estate market posing threats to the Chinese economy and financial system. The rampant speculation on a decoupling of the Chinese economy by (mainly) US policy makers in the last years has exacerbated the overall risk of investing and trading with China. In response to the latter, China has been devising strategies to overcome these problems, such as to further the economic relationship with other Asian countries through the Regional Comprehensive Economic Partnership, and with the EU (Hu et al. 2021). However, efforts for an EU-China investment agreement appears to have stranded, in part due to increased tensions over Xingjian and the reluctance of the Chinese leadership to condemn Russia's invasion of Ukraine (Yee, 2022).

2.3 Foreign News Coverage on China

Research has posited that the perception of China abroad is still largely shaped by international media as opposed to the Chinese media (Sun, 2009). Wasserman's (2016) work on the Chinese media's influence on South African editorial agendas shows that it faces significant challenges as journalists either did not read Chinese media or rejected its perspective on events. The resurgence of the Chinese propaganda system controlling all Chinese media outlets (domestic and abroad) has further exacerbated the issues of mistrust and incongruity regarding Chinese news coverage (Brady, 2017).

Therefore, relatively more research has been conducted on international media reporting on China. Peng (2004) has shown that US news coverage of China has increased significantly in the 1990's, but that articles often employed political and ideological frames

and were subsequently negative in tone. The view that US media has political biases in news coverage of China seems to be supported by Stone & Xiao (2007) who have observed increasingly negative reporting on China since the fall of the Soviet Union and that frames used on the Soviet Union were being applied to China, reflecting the shift from Russia to China as the biggest adversary of the U.S. Studies on European media coverage of China shows similar results. Lams' (2016) research on Belgian and Dutch media supports Willnat & Luo's (2011) view that they consistently portray China with frames of human rights, political containment, and economic trade. Furthermore, Griffiths (2013), has looked at The Economist and the BBC, finding that 83% of all coverage of China were either related to politics, the economy, national security, human rights, or the environment. More than half of all coverage was only on the first two topics and the author concludes that there is a narrow news agenda concerning China, and specific narratives dominate coverage.

A specific topic that is well researched is the coverage on the Belt & Road initiative, a global infrastructure development plan launched by China in an attempt to increase economic relations with the rest of the world. Arifon et al. (2019) looked at media discourse in the UK, France, Spain and Germany, and argued that European media coverage is dominated by geopolitical, strategic, economic and political concerns regarding this issue. Furthermore, comparing between US and EU media coverage of the Belt and Road initiative, Malik (2020) found that US media coverage of the issue exceeds that of EU countries. Moreover, while the US media focused more on political issues related to the project, EU media mainly highlighted economic issues. Looking at media coverage in the CEE region, Matura (2018) in his analysis of Hungarian and Slovak media, found that media reporting on the Belt & Road initiative was relatively low in comparison to general news of Chinese economic relations, which was predominantly focused on the China-CEE partnership (the 16 + 1 initiative). However, the

news that was published was heavily politicized, as media with close ties to the governments reported in a more favorable way than opposition media.

While western media coverage of China appears well studied, no research has been found that specifically looks at the coverage of the Uyghur genocide. Yet, other Chinese human rights violations have been looked at extensively, such as the 1989 Tiananmen square massacre and the Hong Kong protests in 2014 and 2019. Krumbein (2015) notes that human rights reports of US newspapers covering the events in 1989 reflected the human rights position of the state, and they subsequently published the same information as government reports. Kim (2000) goes even further by saying that US news coverage of the event was largely shaped by the government response to the movement and that its views coincided with that of the state. Wang & Ma (2021) strengthen this argument by looking at US coverage of the 2019 Hong Kong protests, and see concurrent results, making the bold claim that the American media is on its way to become as politically driven as Chinese media. It also does not only seem to be limited to the US media, as Veneti et al. (2016) see a similar phenomenon looking at a UK newspaper covering the 2014 Hong Kong protests and argued that coverage was reflexive to the British media system and its national standpoints.

3. Theoretical Framework

3.1 The Role of the Media

The question of the relationship between the media and society has been a topic academic debate, just as the question of what role the media (ought to) have. There is a general consensus on the existence of an interaction between the media and society, although its extent and direction are still contested (McQuail, 2006). However, wider literature on media has identified four main roles of journalism which can overlap: monitorial, facilitative, collaborative and a radical role (Ibid & Nordenstreng, 2006). The monitorial role encapsulates the informational function the media has. It has to “maintain a constant surveillance on the world [...] with relevance to the media’s own public, [...] acting as a conduit for information and views from a range of other sources in society (McQuail, 2006. p.55). The facilitative role refers to journalism as providing a line of communication between citizens and the government. The collaborative role journalism can have is argued to come up in situations such as disasters, crises, or war wherein media collaborates with other external agencies in order to cater to wider needs of society. Finally, the radical role is argued to be found primarily outside of mainstream media and encompasses media defending certain groups, issues, or ideological positions on normative grounds. A more specific and often-cited role of the media, which lies between the monitorial and radical role outlined by McQuail (2006), is their supposed watch dog function of government institutions by collectively keeping the government responsive and responsible (Whitten-Woodring & James, 2012).

The extent to which the media performs these different roles can be argued to be dependent on the specific system within which the media is located. Hallin & Mancini (2004) identify three models of media system development, the liberal, democratic corporatist and Mediterranean model, and argue that media plays a different role in politics in each of these

systems, based on the role of the state, the extent of political parallelism and professionalism amongst journalists. Media systems therefore appear to have a big impact on news reporting, both in terms of what is covered and how it is covered, and the emphasis on different roles of the media can arguably also result in varying considerations in news and topic selection.

3.2 News Values: Which Events Reach the News?

The various roles of the media can help to shed light on the question what factors determine stories and events reaching the news. The seminal work of Galtung & Ruge (1965) can be seen as having introduced the contemporary notion of news values. Having provided the basis for a new field of academic literature, a plethora of studies emerged, most notably Harcup & O’Neill’s (2001) attempt to update Galtung & Ruge’s model, as well as Joye et al. (2016) the books by Bell (1991) and Bednarek & Caple (2017). Aggregating the findings of these authors, one can identify the following general news values (table 1).

Building on the development of news values, scholars have introduced the concepts of deviance and social significance as theoretical dimensions that can be used to group these values in relation to foreign news coverage (Shoemaker et al. 1991; Shoemaker et al 1987). Deviance is based on the event in question and can either be normative in the sense that it breaks with domestic norms, or deviant in the sense that the event challenges the status quo in the country and creates the potential to affect social change (Shoemaker et al, 1991). It appears to be a strong determinant of news, not only for the US print and television press, as it could also be seen in various European offline and online media as well (Wendelin et al. 2017). Furthermore, Diakopoulos & Zubiaga (2014) have also found that event deviancy is a strong news determinant on Twitter, suggesting that this is a wide-spread phenomenon and encompasses both traditional and new media.

Table 1. Aggregated Overview of News Values

News value	Meaning	Author
Frequency	Events occurring suddenly will receive more news coverage than long term trends.	Galtung & Ruge (1965)
Meaningfulness	Events that are closer related or relevant to audience will be more likely to be selected as news (e.g geographic proximity, cultural and economic ties).	Joye et al. (2016)
Conflict	Events involving conflict are more newsworthy than events lacking conflict.	Bednarek & Caple (2017)
Unexpectedness	Rarity and unexpectedness of events increase its news value.	Harcup & O’neill (2001)
Negativity	Bad news is considered more newsworthy than good news.	Bell (1991)
Unambiguity	Events which are easier to understand and oversee their implications are more newsworthy than “ambiguous events”.	Bell (1991)
Eliteness	Events involving “elite” nations or actors are considered more newsworthy.	Galtung & Ruge (1965)
Superlativeness	The larger the event, the higher chance it will be selected as news.	Bell (1991)

Building on the development of news values, scholars have introduced the concepts of deviance and social significance as theoretical dimensions that can be used to group these values in relation to foreign news coverage (Shoemaker et al. 1991; Shoemaker et al 1987). Deviance is based on the event in question and can either be normative in the sense that it breaks with domestic norms, or deviant in the sense that the event challenges the status quo in the country and creates the potential to affect social change (Shoemaker et al, 1991). It appears to be a strong determinant of news, not only for the US print and television press, as it could also be seen in various European offline and online media as well (Wendelin et al. 2017). Furthermore, Diakopoulos & Zubiaga (2014) have also found that event deviancy is a strong news determinant on Twitter, suggesting that this is a wide-spread phenomenon and encompasses both traditional and new media.

The second dimension is social significance and can apply to both the event and the country. As for the event, Wendelin et al (2017) identify importance, consequence and impact of the event as important factors that create news value. Social significance of the country is

based on its general importance and the political, economic, and cultural significance between the domestic and foreign state (Shoemaker et al. 1991). Concerning social significance of countries, different indicators relating to these elements have been identified and can also all be placed in the “meaningfulness” and “eliteness” news value determinants in table 1. As for the country in question, GDP, military, and population size appear to be indicators determining the country’s news value (Maier, 2021). In terms of state relations, political relations encompass military alliances, economic aid, military presence, and general political ties, whereas economic relations include trade and FDI. Cultural significance has been denoted by ethnic and religious similarity (Shoemaker et al. 1991).

Research into the strength of each indicator has shown two things. First, deviancy and social significance are by themselves strong predictors of news coverage of a foreign event, even though it is still contested which element is stronger (Ibid & Wendelin et al. 2017). Secondly, it has also revealed that, besides the size of the country, economic relations are by far the strongest indicator that falls under the dimension of social significance in terms of state relations and applies to both traditional newspapers, television press, and new online media across all countries with a free press. Economic relations have been primarily looked at through the lens of trade. Wu (2000) has shown in his research of foreign news reporting in 38 countries that the extent of trade was the strongest predictor of news coverage. These results are corroborated by later findings by Wu (2007) on the US media and those by Maier (2021), as well as Golan’s (2008) work on US news coverage on African states and Cazzamatta’s (2018) paper on German news coverage of Latin America. To a lesser extent, the amount of FDI is also seen to positively correlate with foreign news coverage (Lee, 2007; Maier, 2021 & Wu 2000).

3.3 How Media Reports on Foreign News

The section above has outlined what determines the newsworthiness of foreign events and has put forth the claim that economic relations are a strong predictor of foreign news coverage. However, it does not answer the question *how* foreign events are covered and what factors can explain variation in this regard. One of those factors that explains the difference in the nature of coverage across states is simply the country itself. Many studies have shown a universal phenomenon whereby foreign news is “domesticated” in the sense that foreign events get covered from a national angle and logic (Eide & Ytterstad, 2011; Clausen, 2004 & Olausson, 2014). This domestication happens through a variety of ways, by for example highlighting the involvement of nationals or by discussing the implications of the foreign event to the domestic country. Therefore, as Clausen (2004) says, “global news is particular to each country” (p.27). Furthermore, it appears that domestication of foreign news does not only happen through selecting stories of an event that are relevant to the home audience, but also that it covers events through frames that are compatible with the culture and values of their society (Gurevitch & Levi, 2005). This is in part a result of the performing its monitorial and facilitative role, as these practices are argued increase the understanding and visibility of the foreign event by the domestic audience (*ibid*). Yet, there have also been arguments made highlighting the strong influence historical and cultural traditions, as well as the socio-economic and political environment, has on journalist reporting (Nossek, 2004). Some scholars, such as Chomsky & Herman (2002) go even further by showing the tendency of journalists to report events in favor of national interests, as they did in the Vietnam and Soviet-Afghan wars. This is supported by Riegert (2011), who also shows that foreign news reporting tends to reinforce the national perspective of events.

Another factor that is argued to influence not only how events are covered but also which events are covered, is the extent to which national news correspondents and journalists

are present in the country. Otto & Meyer (2012) have noted a systemic reduction in foreign news correspondents and regional bureaus and argued that this has harmed the ability of the media to uncover and report on humanitarian crises and security threats. The importance of having locally grounded journalists present in the country is also emphasized by Paterson et al. (2012), who saw the relationship between foreign journalists and local “fixers” as instrumental in the ability to provide news coverage of stories that go beyond the narrative of official sources. The trend of “parachute journalism”, by which foreign correspondents are dropped in complicated conflict areas and are thus not locally “grounded”, is argued to increase the chance that the reporting will miss facts and be over-simplified (*ibid*). The importance of individual journalists is also mentioned by Lams (2015), who saw in her study on Belgian and Dutch news coverage on China that individual correspondents had a large impact in how issues were covered. The presence of regional bureaus or permanent correspondents have in the last decades more and more been dependent on cost considerations and therefore news agencies will only invest in these if the country has enough news value, which is dependent on the factors discussed previously.

3.4 Expectations and Hypotheses

In sum, the literature mentioned in this chapter has given this thesis ample grounds for formulating expectations on the outcome of this research according to the theory. On the question of general news coverage on a foreign country, one can, following the theory of news values, expect more extensive foreign coverage of a state with which the media’s own country has stronger economic relations. This is because the news value of the country (and thus events happening in it) is higher due to these relations.

Furthermore, it has been consistently shown that the media attempts to domesticate foreign news events by focusing on the national relevance and reporting in accordance with national norms and values. Despite the apparent low news value of human rights violations by themselves, the argument can be made that the strong human rights discourse existent in many liberal democratic states during this study's timeframe, combined with domestic discussions regarding treatment of various minorities and the European refugee crisis in 2015, would increase the overall relevance of stories regarding human rights violations on ethnic minorities.

However, one can expect that news will focus on those events in countries that are more relevant to the domestic audience, as a selection needs to be made on which of the (numerous) foreign human rights violations will be featured. Given the importance of economic relations in predicting foreign news value, one can hypothesize that there will be more news coverage on Uyghurs in countries with stronger economic ties to China than in countries with weaker economic ties to China.

Moreover, one can expect that the increased news value of the country should lead to increased attention by journalists and could entail the placement of more permanent correspondents who can focus their reporting on longer term trends and issues. One can therefore, relating back to the research question at hand, expect that coverage on Uyghurs will be more sustained (i.e., more regular) and will have started earlier in countries with stronger economic ties to China than in countries with weaker economic ties to China.

Even though one can expect countries with weak economic ties to still report on the situation of the Uyghurs in Xinjiang, one can expect that this will consist of relatively more short-term news value events, such as another, more relevant, country or entity getting involved. This can be considered as “elite” involvement, in Galtung & Ruge’s (1965) words. An example could be U.S involvement in conflicts abroad, as Qian & Yanagizawa (2009) found that the strategic use of human rights reporting by the U.S government led to short term

news value. Furthermore, domestication theory posits that foreign news stories that include domestic involvement will often have a higher news value than news with no domestic angle. Therefore, given the lower news relevance of China by itself, one can formulate the hypothesis that countries with weaker economic ties to China will cover the Uyghur genocide to a greater extent in relation to domestic involvement and the involvement of elite actors.

It should again be emphasized that these expectations do not apply to every country, as media in non-democratic states can be argued to act differently than media in liberal democratic states, given the likelihood of censorship and government control. A liberal democratic system with a free press is therefore an essential qualifier for the expectations set. Having outlined these general theoretical expectations, this thesis can now formulate the hypotheses that will be tested in this research:

H1: There will be more news coverage on the Uyghur genocide in countries with stronger economic ties to China than in countries with weaker economic ties to China.

H2: Coverage of the Uyghur genocide will be more sustained and will have started earlier in countries with stronger economic ties to China than in countries with weaker economic ties to China.

H3: Countries with weaker economic ties to China will cover the Uyghur genocide to a greater extent in combination with domestic or elite involvement.

4. Methodology

The previous chapters have outlined the relevance of launching an inquiry on the question to what extent economic relations impact news reporting in European states on human rights violations against Uyghurs. We have formulated several hypotheses this thesis aims to test. This chapter outlines the methodology and research design. It starts with a section on the operationalization of the two main variables: economic relations and media coverage. The following section discusses the case selection, first justifying the reasons for looking at the Uyghur genocide as a human rights violations case and then identifying two case countries whose media will be researched, after which it justifies the use of newspapers and select specific outlets. Lastly, a section is devoted to data collection and the coding procedure.

4.1 Operationalization of Economic Relations and News Coverage

4.1.1 Economic Relations

In order to measure the economic importance of China to the case countries, this thesis uses the indicators employed by Lee (2007) regarding economic significance. These consist of the trade size between the two countries and the amount of FDI coming from China. In order to control for factors such as economic size and other trade relations, this thesis used received FDI relative to the country's Gross Domestic Product and assesses trade relations in terms of Import and Export partner share, which denotes the percentage of imports (exports) coming from (going to) a partner country of the total imports (exports) of the destination (source) country. The extent of these economic relations is assessed from the period of the 1st of January 2010 to 31st of December 2020. The reason for this timeframe is as to include enough years to gain an understanding of the extent of trade relations in the medium term. 2020 has been chosen as the last year given that it was the most recent date where specific data on import and export

partner share were available. Regarding trade, the average Import and Export partner share between 2010 and 2020 will be used. In terms of FDI, this thesis will use the total Dollar amount of received FDI in this period relative to the country's GDP in 2020.

Economic data was collected from various sources. First of all, this thesis uses "The China Global Investment Tracker" (CGIT) by the American Enterprise Institute in order to measure inward FDI originating from China. This tracker allows one to identify the exact amount of Chinese FDI per year and per country and for which specific projects money was invested. It is therefore a powerful tool to assess in detail the development of Chinese investments in this thesis' case countries. Secondly, data relating to trade is collected from OEC (Observatory for Economic Complexity) and GDP data has been found through World Bank Open Data.

4.1.2 Media Coverage

The analysis of media coverage is conducted through a qualitative content analysis. Firstly, it is necessary to research how much media coverage there has been of the Uyghur genocide in the countries this thesis has chosen to take as cases and how prominent articles were featured. This will be assessed by looking at the number of published articles, word count of those articles and where in the newspaper they have been published.

Secondly, the relevant news articles are analyzed in order to assess the actual content of these news stories and to look for similarities and differences between reports in different countries. Key elements regarding content are the topics which within Uyghurs are covered and whether the media sees the human rights abuses in Xinjiang as a genocide (cultural or otherwise). Given a lack of a clear pre-existing framework, an exploratory sample and

subsequent analysis of the sample was conducted to construct the bulk of the coding manual, which will be discussed in a subsequent section.

4.2 Case Selection

4.2.1 *The Uyghur Genocide*

Given China's Human Freedom Index ranking of 150, there have been multiple human rights violations in China that could have been used as a case in this study, such as the crackdown of the Hong Kong protests and repression in Tibet. However, the choice of selecting the repression of Uyghurs in Xinjiang as a case is warranted for several reasons. Firstly, it concerns a case that is ongoing and has lasted for more than a decade. It is an event that is not marked by large scale explosive clashes between people as was the case in Hong Kong, as instead these events take place gradually and outside of the public view. One can put forth the argument that the situation in the XUAR will be much more covered as a "true" human rights event as it will not be influenced by the "newsworthiness" of violent clashes as was the case with the 2019 student protests. Secondly, the situation in Xinjiang has been thoroughly reported on by NGOs such as Amnesty and Human Rights Watch over this period of time, which should increase the visibility of the issue to the media. Thirdly, the scope of these human rights violations is beyond what the world has seen in recent decades, including up to 12 million people living in the XUAR. The nature of these crimes is also extreme. Mass internment, surveillance, sterilization and stigmatization of a group of people based on ethnicity and religion are reminiscent of the darkest pages in the world's history and are therefore also universally condemned by European states. The treatment of Uyghurs is not a debate subject as it stands in clear opposition to EU norms and values regardless of ideological position, and one can therefore not expect news coverage to be influenced by ideological interpretation.

4.2.2. Countries

In selecting countries as cases for this study, it was deemed important to control for extraneous variables and keep cases as similar as possible besides the independent variable of interest according to a Most Similar Research Design. This design was opted due to the fact it is seen as a robust method in cases of deductive and variable-oriented research approach (Ancker, 2008). As was shown in the Theoretical Framework chapter, how the media functions is in large part also dependent on the existing media system in which it is located (Hallin & Mancini, 2004). It was therefore deemed important to include media system theory in the case selection process of this thesis, as is common in other studies relation to media coverage (Hallin & Mancini, 2017). Furthermore, this thesis has attempted to control for other variables that could affect foreign news coverage on the Uyghur genocide, such as country size, geographic proximity, language and other cultural factors, for example the number of Uyghurs residing in the country. Following this selection process, this thesis has chosen two countries: Belgium and the Netherlands. This section will outline the justification for this choice and why it will strengthen the research at hand.

First of all, the two countries are neighboring states and are both relatively small states within Western Europe. There is a close economic and political cooperation between the two, not only through the EU but also via the Benelux Union. Furthermore, they have a shared history, culture and (to a partial extent) language. They also have aligned security interests given their membership of NATO. There are also extensive links between the two populations, with many Belgians living in the Netherlands and vice versa. These links also extend to the media. Both countries are placed in Hallin & Mancini's (2004) Democratic-Corporatist model. Moreover, the shared language in Flanders and the Netherlands has also allowed the two media systems to be arguably one of the most interconnected ones in Europe given the extensive cooperation between news agencies. For example, Flemish Public news broadcasts often work

together with Dutch counterparts by for instance pooling foreign news correspondents (VRM, 2016). Newspapers also feature this cooperation and are also linked through company ownership. For example, DPG Media is a Belgian media group which owns Belgian quality newspaper “*De Morgen*”, but also owns two large Dutch national newspapers, *De Volkskrant*” and “Trouw”. Subsequently, Belgian holding Mediahuis controls the Belgian “*De Standaard*” and Dutch “*NRC Handelsblad*” newspapers. As a result, some foreign news correspondents report for both Dutch and Flemish newspapers. Lastly, and more specifically related to the Uyghur case, there have been a relatively similar number of Uyghurs living in both countries, a 1000 in Belgium and 2000 in the Netherlands (IODE, 2022), translating to roughly 0,011% of the population in the Netherlands and 0,008% of the Belgian population.

However, a major difference of these countries is on the independent variable of interest, namely economic relations with China. The following table (Table 2) outlines the economic importance of China to the Netherlands and Belgium. Having controlled for GDP, one can see that the Netherlands gained a significant higher share of Chinese FDI compared to Belgium. Furthermore, China is a vastly more important trade partner to the Netherlands in terms of imports, being its second biggest import source with an import partner share averaging around 10% between 2010-2020, and its largest extra-EU importing source (Germany being first). In contrast, only 4% of all Belgian imports were sourced from China. Despite a similar export dependence on China, one can still discern that the Netherlands has had much stronger economic ties to China than Belgium has had in the timeframe. Furthermore, the data also shows a rising trend concerning Dutch trade relations with China, which cannot be seen in Belgium. A full overview can be found in Appendix 1.

Table 2. Aggregated overview Trade & FDI between China and Belgium/Netherlands

	GDP (2020)	Chinese FDI (2010-20)	FDI/GDP (2020)	Import Partner Share (2010-20)	Export Partner Share (2010-20)	Import Rank (2020)	Export Rank (2020)
Netherlands	912,2	15,71	1,73%	10,37%	2,21%	2nd	8th
Belgium	515,3	1,95	0,38%	4,1%	2,19%	6th	8th

Table 2. Aggregated overview Trade & FDI between China and Belgium/Netherlands. Own table: data collected from WITS, CGIT and World Bank Open Data. In USD (Billion).

4.2.3 *Media and Newspapers*

This thesis has decided to use traditional media, and in particular quality newspapers, for this analysis as it has been shown that “quality” or “elite” newspapers are still very important agenda-setting agents, both for national broadcasts, local, and non-elite media , and even for social media (Dotson et al. 2012). Furthermore, as they are bound by size, what articles get published and which place they get in the newspaper can clearly show which stories editorials find worthy to publish. Three newspapers will be analyzed per country and were selected on the basis of readership, ideological spread and on the criteria of being a “quality newspaper”. They also had to have daily publications. Regarding Belgium, one Francophone and two Dutch-language newspapers have been chosen given the importance of both languages in the country. The newspapers are outlined in table 3. *De Volkskrant* is a Dutch daily newspaper with catholic roots and is considered to have a centre-left political leaning as opposed to *NRC Handelsblad*, a paper with a liberal origin and which is argued to adopt a centre-right political stance. *Trouw* was originally an orthodox protestant newspaper published illegally during the Nazi occupation of the Netherlands. It distinguishes itself from other Dutch daily quality newspapers by its increased focus on religion and philosophy. Turning to Belgium, *De Morgen* is a Flemish daily newspaper with socialist origins and is therefore also

considered to have centre-right leanings. *De Standaard* has catholic Flemish roots and is considered more centre-right. *Le Soir*, the only Walloon and francophone newspaper, was never part of a pillar or ideology, although it is currently considered to be a progressive centre-left news outlet.

Table 3. Newspaper Selection

Newspaper	Country	Owner
De Volkskrant	Netherlands	DPG Media
NRC Handelsblad	Netherlands	Mediahuis
Trouw	Netherlands	DPG Media
De Standaard	Belgium	Mediahuis
De Morgen	Belgium	DPG Media
Le Soir	Belgium	Rossel & Cie. S.A

Table 3. Newspaper Selection (Own table)

4.3 Data Collection

Data is collected from two databases, NexisUni and Gopress for Dutch and Belgian newspapers respectively. All articles on China by the aforementioned newspapers have been collected from January 1st, 2015, to December 31st, 2020. Using their search engines, search terms of “Uyghurs” and “Xinjiang” (in Dutch and French) were used to identify every newspaper article discussing Uyghurs, which were then put in a dataset for analysis. These keywords have been deliberately made broad enough to avoid what Soothill & Grover (1997) call “false negatives”, in their assessment of keyword analysis using LexisNexis, namely that the keyword is too specific and thus omits potentially relevant articles. In order to counter the

issue of false positives, i.e., irrelevant articles, due to the broad keyword search (*ibid*), this research has manually checked and assessed the relevance of each article in the dataset.

4.3.1 Coding Manual and Procedure

Having collected all the newspaper articles on China and having identified all articles on Uyghurs, this thesis built its coding manual used for the content analysis. From both the theory and common sense, several categories are already evident, such as publication date, specific newspaper, page and publication section, word count and author. Another category is whether the article refers to genocide. However, in order to develop topics that can be assigned to each article we conducted an exploratory analysis of 25 randomly selected newspaper articles from a pool of articles above 500 words that mention Uyghurs. This has been done to adhere to Hsieh & Shannon's (2005) approach of conventional content analysis and to inductively construct categories for the coding manual. Attention was paid developing topics that are easily identifiable from the article alone. In order to aid the reliability of conducting a coding exercise by oneself, each article in the dataset is given a unique number which, together with the plain article text, is the only data available when applying the coding manual to the newspaper articles, which were ordered randomly. After this procedure, the other relevant data hidden during the coding exercise became available during the interpretation of the results.

From this exploratory analysis, nine topics were developed (Appendix 2). These are: Human rights, terrorism, culture, domestic angle, foreign angle, Chinese response, politics and diplomacy, soft power, and companies. Articles are coded as having a human rights topic if the focus of the article is on human rights abuses, such as reports of mass detainment, religious repression etc. The terrorism topic is assigned to articles discussing Uyghurs as (potential) terrorists or articles discussing terrorist attacks with Uyghur involvement. Culture includes

articles whose main topic is on Uyghur cuisine or traditions. Articles are coded as having a domestic angle if the main topic is on a domestic element related to Uyghurs, such as the actions of national politicians, involvement of domestic companies or actions taken by Uyghurs living in the country. Stories with a foreign angle include articles which are about Uyghurs in countries outside of China, such as the Uyghur diaspora living in Turkey. Articles on the replies of China on criticism of Uyghur policies has been assigned “Chinese response”. The topic of “politics and diplomacy” is assigned to articles whose primary topic is on the involvement of the international political community, and includes stories on sanctions, summits etc. We assigned articles the “soft power” topic which discusses (the threat of) Chinese influence abroad. Lastly, all articles on specific companies have been assigned the “companies” topic.

5. Results

5.1 Distribution of News Coverage

5.1.1 National Differences

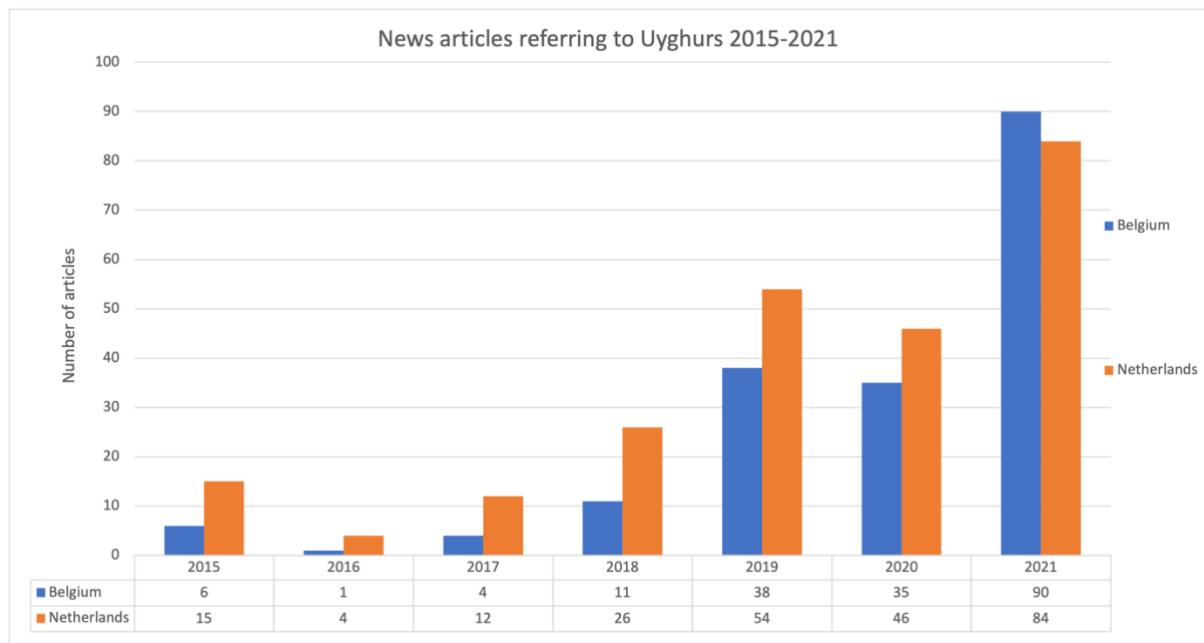

Figure 1. News articles referring to Uyghurs 2015 - 2021

Between the start of 2015 and the end of 2021, this research has identified 1011 news articles which include either the word “Uyghur” or “Xinjiang”, out of 41,509 articles which mention China (23,903 Dutch articles and 17,606 Belgian articles). Having eliminated doubles and irrelevant articles (articles whose main topic was not on Uyghurs, Xinjiang or an issue directly related to their repression), a total of 426 news articles were found. Dutch newspapers have published 241 articles whereas Belgian newspapers have published a total of 185 articles related to Uyghurs within the timeframe. In each consecutive year, except for 2021, Dutch news coverage exceeded Belgian news coverage in terms of individual articles published (figure 1). From 2015 to 2018, Dutch newspapers published at least twice as many articles devoted to Uyghurs than Belgian papers. Only from 2019, Belgian newspaper coverage started

to approximate the number of Dutch articles published, reaching 70% of Dutch coverage in 2019, 75% of Dutch coverage in 2020, after which the extent of Belgian newspaper articles exceeded Dutch ones with 90 to 84 articles respectively.

Moreover, looking at the word count of the news articles, we find that Belgian newspaper articles contained on average 601 words, whereas Dutch articles averaged at 678 words (appendix 3). Again, Dutch articles exceeded Belgian ones in this regard, even having a higher word count in 2021 despite Belgian papers having published more articles (figure 2). The relative difference in word count is also higher compared to the difference in individual articles published, with extremes in 2016, 2017 and 2018, where the number of words in all Belgian articles was around 60%, 90% and 85% lower compared to Dutch news coverage respectively. The difference lowered from 2019 onwards.

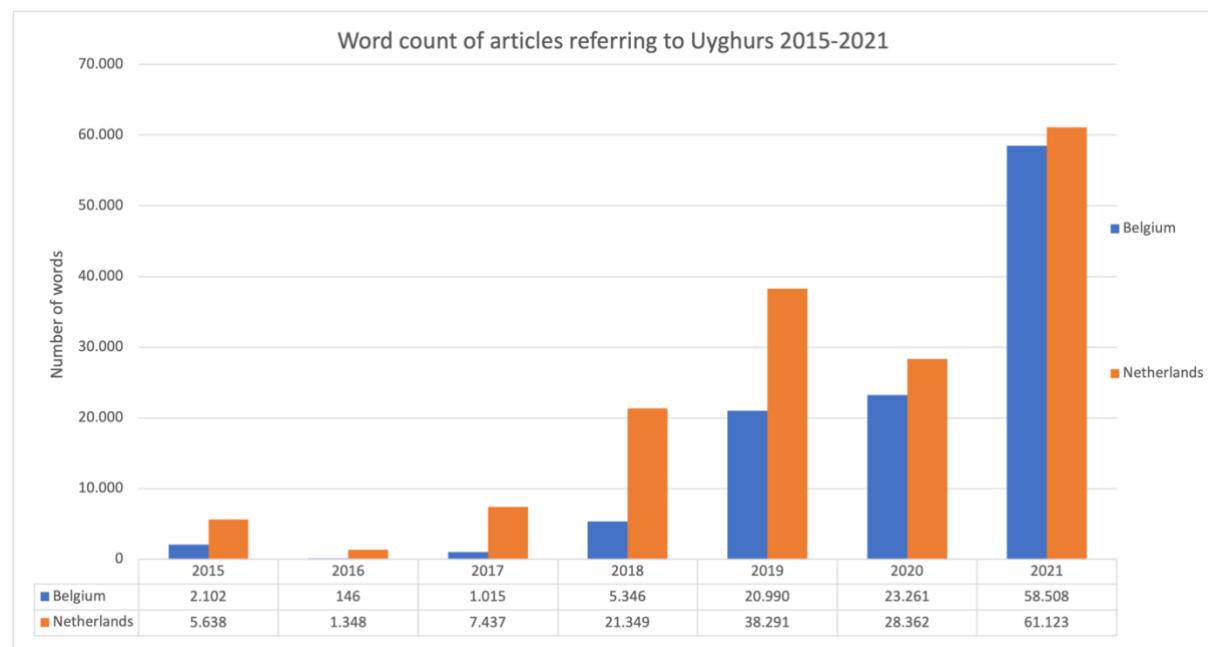

Figure 2: Word count of articles referring to Uyghurs, 2015-2021

We can also look at the positioning of articles, i.e., where articles were published in newspapers, as this can show the importance of topics. Almost 4% of all Dutch articles on the

topic have been placed at the front page, and nearly 6% on the second. Belgian newspapers have only positioned 1,6% of all articles on the front page, and just 1% on page 2 (figure 3). These findings seem to strengthen the previous expectation that Uyghurs have been a more important news topic for Dutch media than for Belgian media, as they produced not only more articles, but also dedicated more words to the topic and have even published more articles on the front page. Furthermore, Dutch media featured significantly more publications than Belgian media in the first four years of the timeframe (2015-2018), only starting to approximate Dutch coverage when the Uyghur issue gained more international attention.

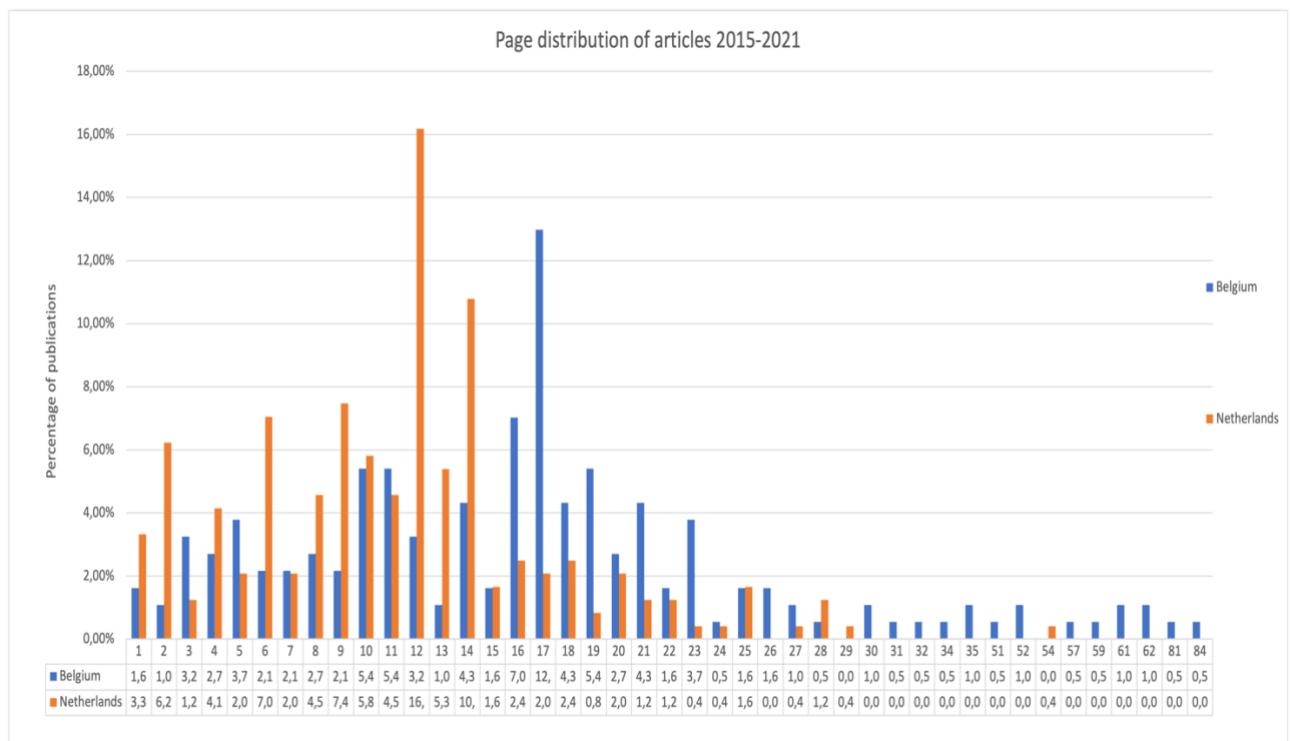

Figure 3: Page distribution of articles 2015-2021

This can also be seen by looking more closely at the distribution of coverage. The first four years (figure 4) are marked by more or less consistent coverage from Dutch newspapers, with news articles published in almost every quarter with the exception of Q1 2016. On the

other hand, Belgian newspapers have published far less consistently, with certain bursts of coverage at the start of 2017 and the latter half of 2018.

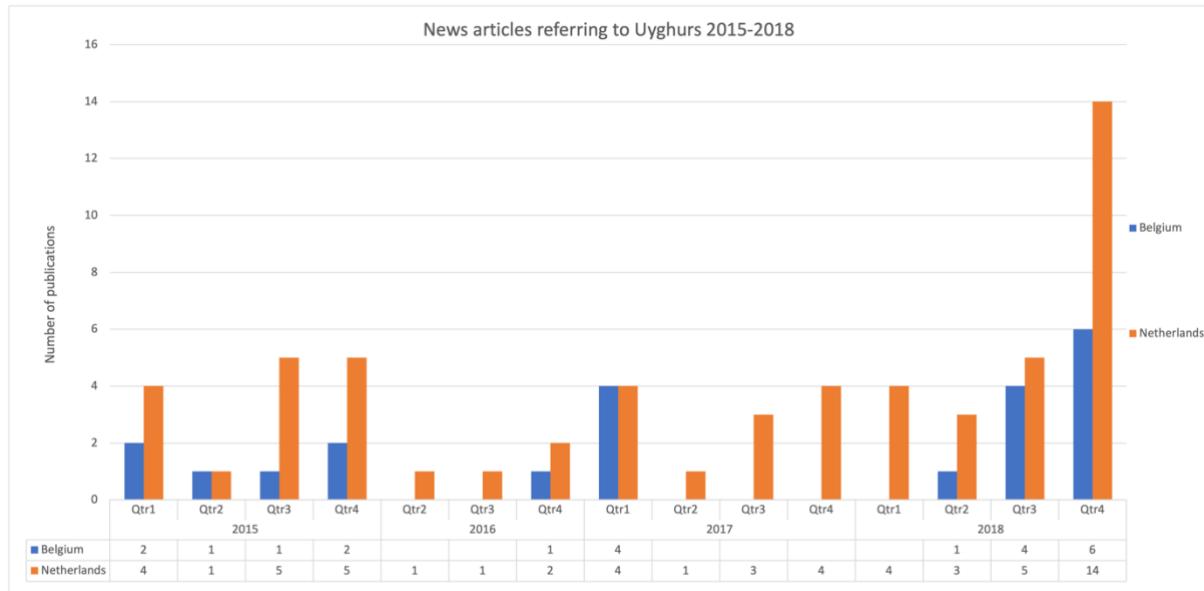

Figure 4: News articles referring to Uyghurs 2015-2018

We can see several things when we look at the articles published in the periods where Belgian coverage approximated Dutch article publications. First of all, 2015 stands out as it was a year where there was more news coverage in both countries on Uyghurs than in the subsequent two years. More than half of the articles published were on terrorism, with the majority discussing the Uyghur connection to the 2015 Bangkok bombing and Uyghur involvement with the Islamic State. The prominence of the terrorism topic in 2015 can be explained by the already strong interest in terrorism stories in European media as a result of the rise of ISIS and subsequent terrorist attacks such as the Charlie Hebdo shooting in 2015.

Belgian news coverage on Uyghurs became sporadic in the subsequent years until the second half of 2018. One exception is the first quarter of 2017, when both Dutch and Belgian newspapers published the same number of articles. Yet nearly all articles were on a single

event, namely on the introduced counter-terrorism legislation in Xinjiang making GPS systems compulsory in cars¹. These results become even more significant if we look at the number of words dedicated to the topic at hand, as we can see that its difference is much higher than by merely looking at the number of articles published (Figure 5). This again indicates that for the Netherlands, Uyghur related topics were apparently more “newsworthy” than was the case for Belgian newspapers, as Dutch editorials have allowed for a significantly higher word count dedicated to this.

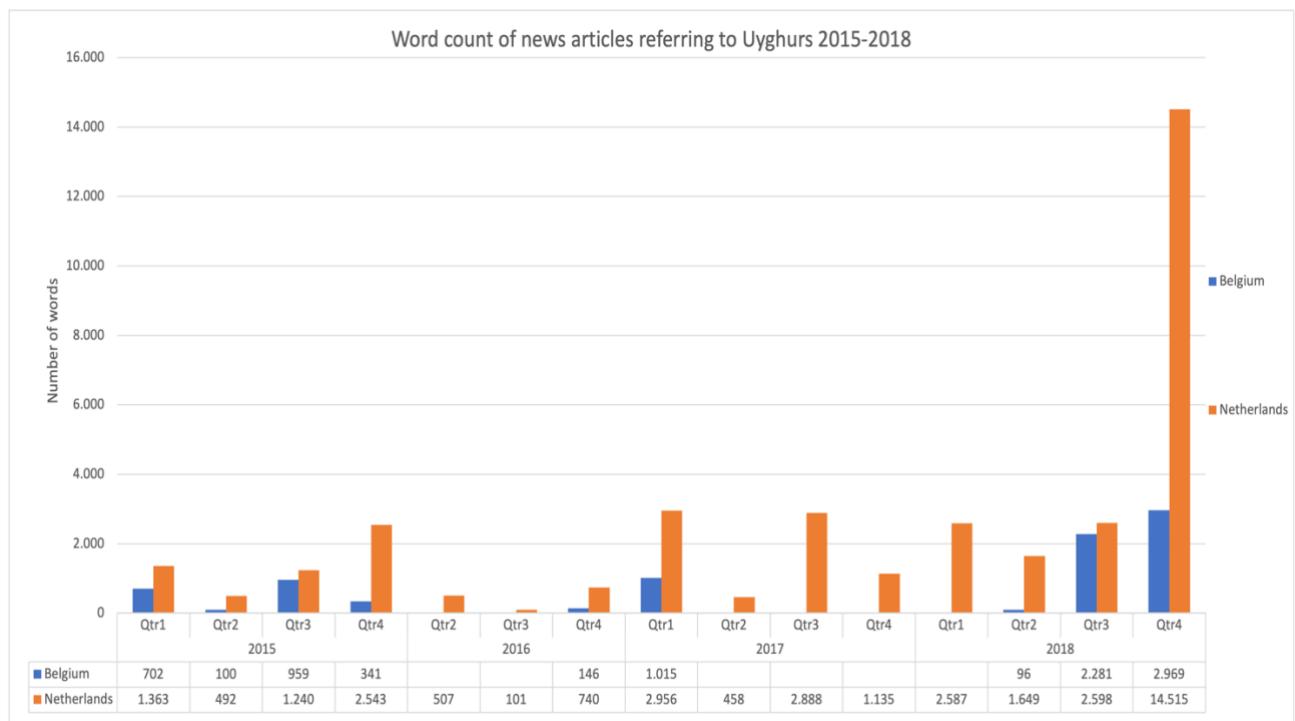

Figure 5: Word count of articles referring to Uyghurs 2015-2018

A different picture emerges if we look at the subsequent years (Figure 6). The second period from 2019 to 2021 is marked by highly consistent coverage of Uyghurs, with similar article publications in most quarters. The difference between the number of Dutch and Belgian

¹ Articles 29-33

newspaper publications is also significantly lower than in the previous period of 2015-2018. Furthermore, a check of the word count has also revealed no large differences in that regard during this timeframe (appendix 4). This suggests that the news value of Uyghur related topics has increased for Belgium newspapers to match that of Dutch newspapers. This can be explained by the increased international attention on the fate of Uyghurs in the XUAR, with NGO's publishing reports and sanctions being announced by other countries.

A finding that should be mentioned is that in 2020, Dutch and Belgian newspapers published less articles on the topic than was the case in 2019 and 2021. This could possibly be explained due to the COVID pandemic having diminished the importance of Uyghur human rights violations for both politicians and the media in that year.

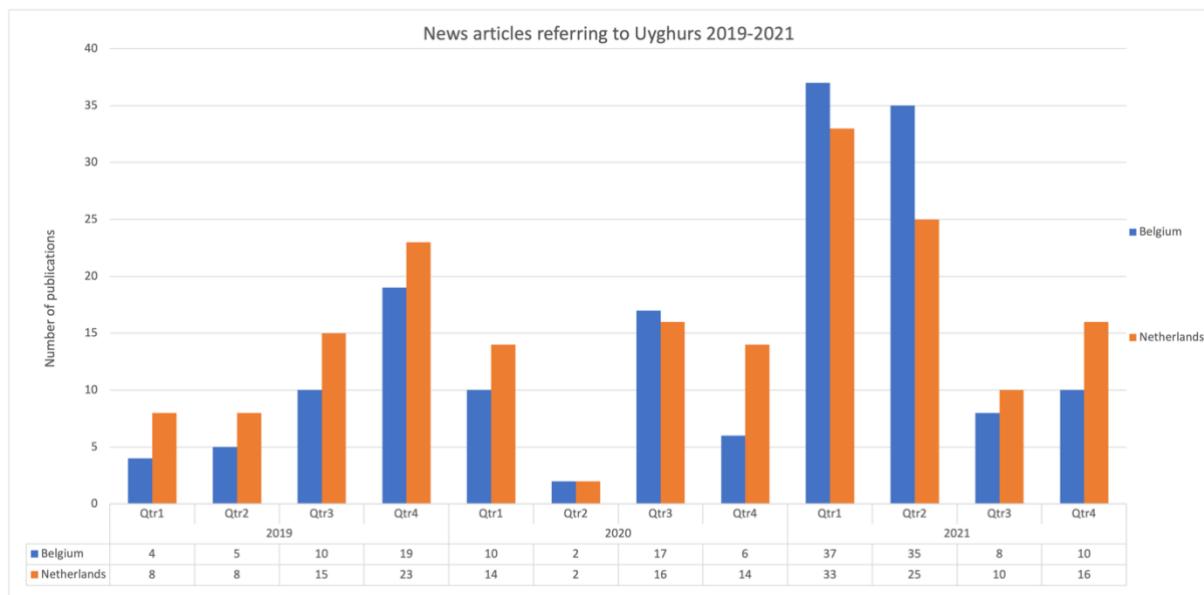

Figure 6: News articles referring to Uyghurs 2019-2021

5.1.2 Newspaper Differences

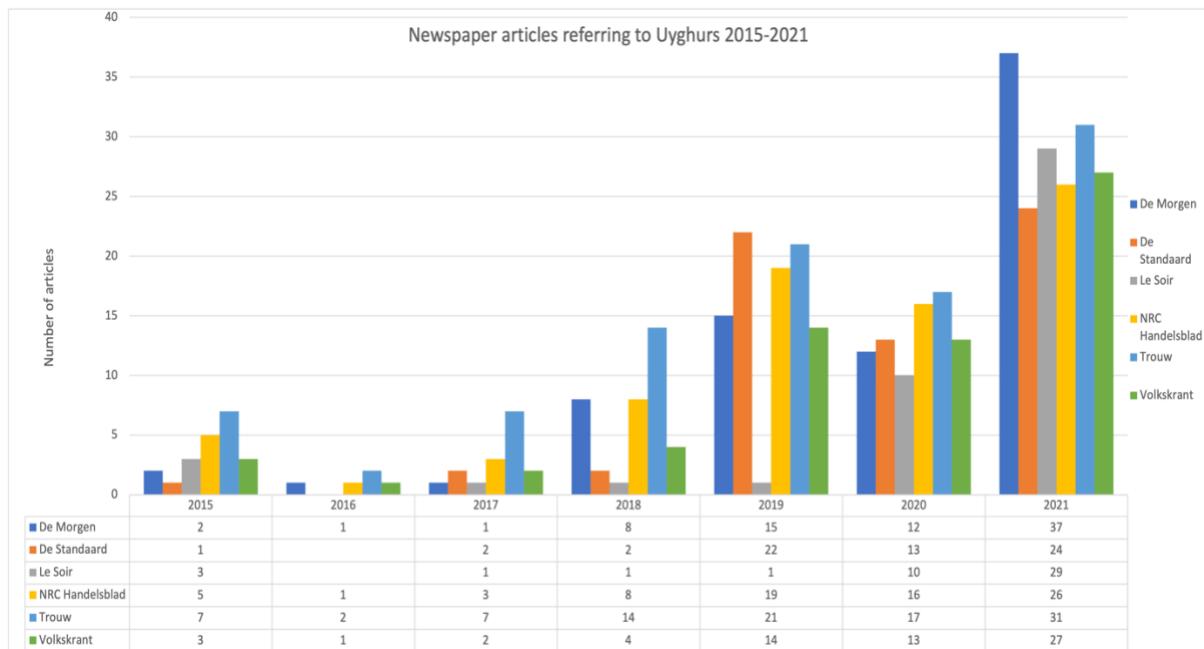

Figure 7: Newspaper articles referring to Uyghurs 2015-2021

Narrowing down the analysis to compare the extent of individual newspaper coverage, we find that it does not appear to be dependent on newspaper ideology. Looking at both individual articles produced (figure 7) and word count (figure 8), we can see large differences in coverage of newspapers that have the same political leaning. Nevertheless, the analysis yielded several findings which are important to mention.

Focusing on Dutch newspapers, we find that they appear to publish a relatively similar number of articles. *Trouw* has published the most articles on this issue, followed by *NRC Handelsblad*. However, looking at the word count one can see that there is no clear outlier in terms of news coverage, as the *Volkskrant* overtakes *Trouw* in several years despite publishing less articles (Figure 8). Nevertheless, it is clear that *Trouw* has covered the issue most consistently. A reason for this is possibly the weekly column on the Islam around the world called “In the shadow of the minaret” by Arabist and journalist Eildert Mulder, who has devoted several of his columns to the fate of the Uyghurs.

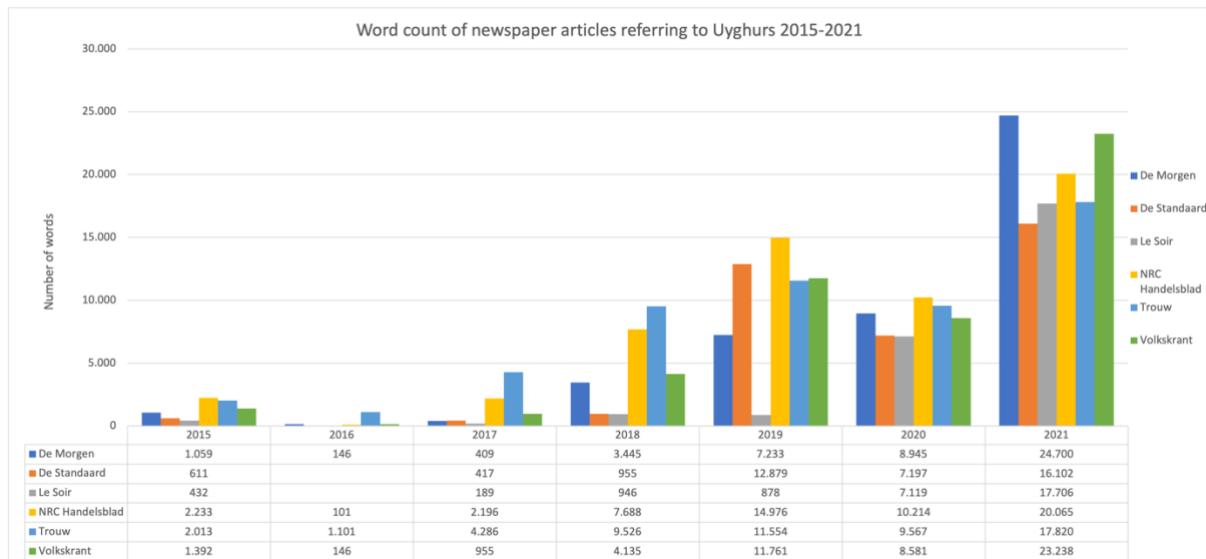

Figure 8: Word count of news coverage referring to Uyghurs 2015-2021

The frequent columns by Eildert Mulder can also explain the results showing that despite the extent of *Trouw*'s news coverage, relatively few articles were published on the first pages, instead the majority of articles being published in the middle of the newspaper between pages 9 and 15. Furthermore, none of their relevant article publications were placed on the front page. In contrast, nearly 20% of *NRC Handelsblad*'s news publications on Uyghur related topics were positioned on the front page or the second page. *De Volkskrant* has published five articles on the first and second page amounting to 8% of all articles they have published on the topic at hand (Figure 9).

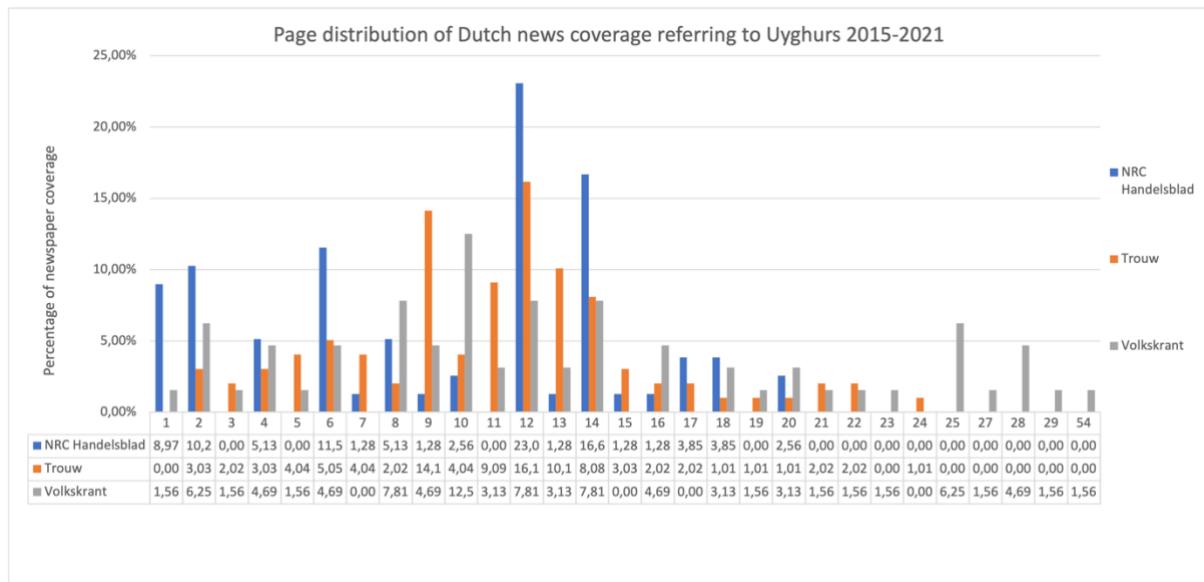

Figure 9: Page distribution of Dutch articles referring to Uyghurs 2015-2021

Turning the analysis to Belgian newspapers, larger differences can be observed. The main finding is the fact that *Le Soir* has published significantly less articles than its Flemish counterparts. Furthermore, *De Morgen* is the only newspaper to have published articles on Uyghurs in every single year, as the other two did not cover the topic at hand in 2016. A look at the word count yields similar results, with *Le Soir* at the bottom of the list. An interesting finding is that despite *Le Soir* publishing most articles in 2015, these consisted of very short articles, and they thus overtaken by the other two Belgian newspapers.

However, looking at the page distribution of articles we can see that *Le Soir* has positioned nearly 8,5% of its published articles on the first two pages, whereas *De Standaard* has published nothing on the Uyghurs on its front page (figure 10). *De Morgen* has only published one article on its front page and no articles on the second page. Just as was the case with Dutch newspapers, the majority of articles are still located in the mid-section of the newspapers. Yet, if we look at the first five pages of the newspaper, *Le Soir* has published nearly 18% of all articles within these pages, followed by *De Morgen* with nearly 16%. *De*

Standaard has published the least in the front of the newspaper, amounting to slightly under 5% of all articles related to Uyghurs.

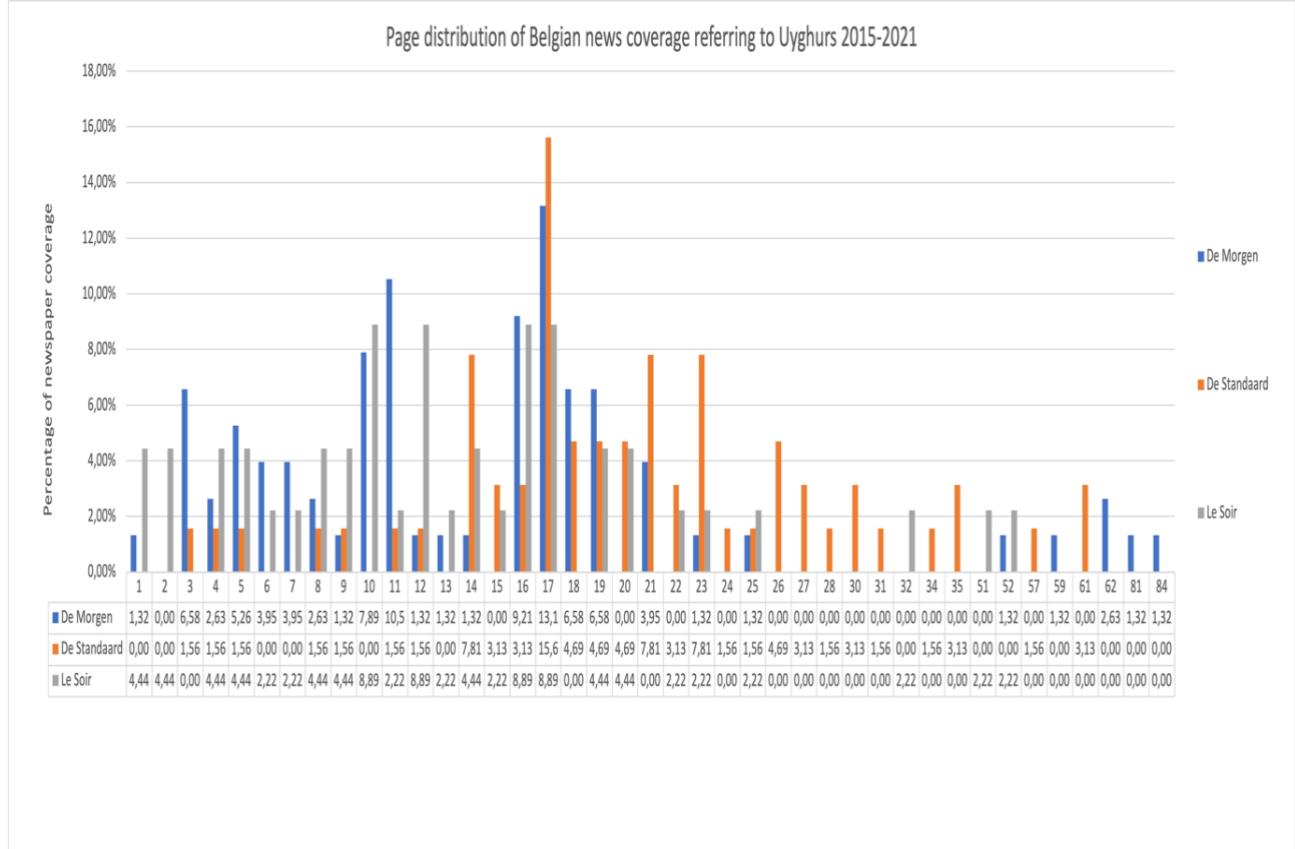

Figure 10: Page distribution of Belgian articles referring to Uyghurs 2015-2021

The results thus do not show any clear indication what causes a variation in distribution of news coverage between individual newspapers. Looking at ideological stance, we can see large differences between both *NRC Handelsblad* and *De Standaard* (considered as centre-right papers), and between *Volksrant*, *Le Soir* and *Trouw* (considered centre-left papers) in terms of articles published, word count and article positioning. The higher extent of news coverage by *Trouw* can be explained by its focus on religion and philosophy, as the argument can be made that from this framework, stories involving religious repression and human rights violations have a higher news value. However, we could not find an adequate explanation for the differences in the extent of coverage between the other newspapers. In particular, the

finding that *Le Soir* has published significantly less articles than its Flemish and Dutch competitors has been one of the most noteworthy results. Yet, an explanation for why this is the case cannot be reliably deduced from the available literature or analysis.

5.1.3 Authorship and Newspaper Ownership

It also appears that newspaper ownership does not impact the extent of coverage on Uyghurs, which has been seen by looking at the coverage between DPG Media, which owns *De Morgen*, *Volkskrant* and *Trouw*, and Mediahuis, which owns *De Standaard* and *NRC Handelsblad*. However, one important finding is that it appears that more authors publish in different newspapers from DPG Media than is the case for Mediahuis. In the former, eight authors were found that published articles in the other newspapers from the parent company. In the latter's case that was only two. Furthermore, looking at authors publishing for both parent companies we find that only one author has published one article for the competing company, indicating that there is no significant cooperation between the two parent companies. When we take a more thorough look at authors publishing in multiple DPG Media newspapers, we can see that many authors publish the same article in multiple newspapers with altered titles. Examples are the mandatory GPS tracker newspaper articles published by the same author in both *De Morgen* and *De Volkskrant*² and the same publications on forced labor in *Trouw* and *De Morgen*³. In total, this research has identified 11 pairs of nearly identical, slightly altered article publications from the same author within the newspapers of DPG Media⁴.

5.1 Topic Distribution

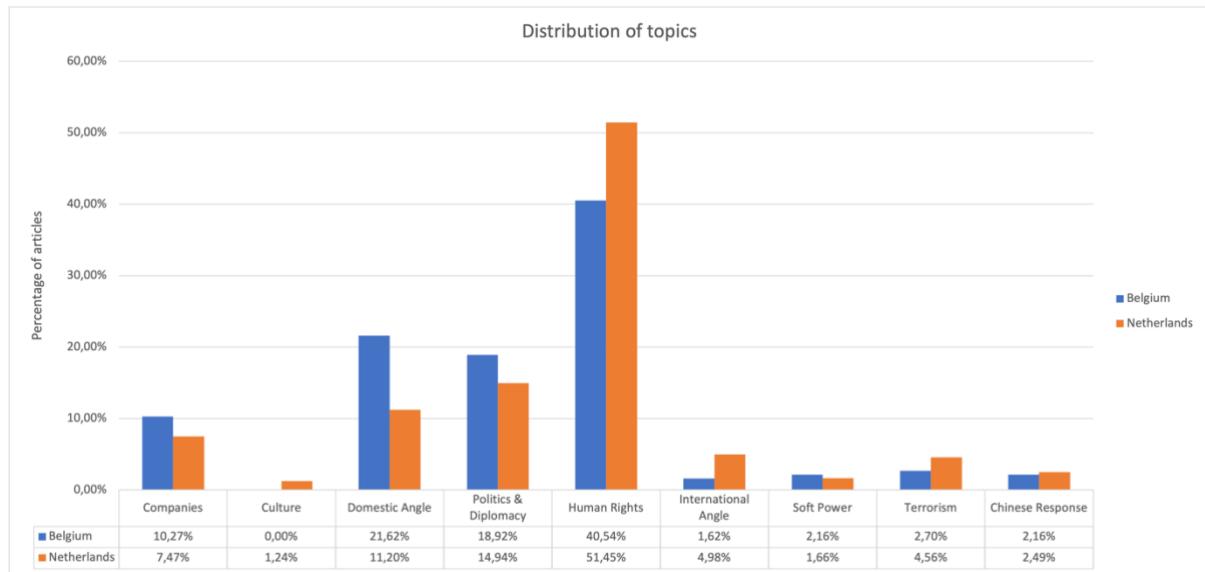

Figure 11: Distribution of topics

Within the dataset of articles on Uyghurs, nine broad topics have been developed during the exploratory analysis, with attention being paid to ensure mutual exclusiveness. The share of articles dedicated to each topic is depicted in figure 11. The first, and arguably most unsurprising finding, is that the highest share of news coverage in both Belgium and the Netherlands was solely focused on Uyghur human rights abuses, 40% and 51% respectively. The three most published topics in Dutch newspapers were, besides human rights, politics & diplomacy (15%) and domestic news (11%). Belgian newspaper coverage was even more concentrated on these three topics, with domestic news articles consisting of more than one-fifth of all their publications, followed by political and diplomatic news at 19%. This leads us to our second main finding, the relatively high share of articles covering Uyghurs from a domestic angle in Belgian newspapers. The fact that even Dutch newspapers published many articles from a national angle seems to confirm domestication theories. Furthermore, the fact that the share of articles on politics and diplomacy was also sizable can also be explained using

news values, given the increased newsworthiness of topics when elite actors such as the US and U.N start to get involved.

Another finding that should be mentioned is that Dutch newspapers published three articles whose main topic was Uyghur culture, a topic which completely lacked in Belgian newspapers. A closer look at these articles reveals that two discussed Uyghur cuisine and restaurants and the third was an interview with a Uyghur musician⁵. As it is the case that both countries feature Uyghur restaurants and a comparable number of Uyghur residents, the reason for this discrepancy cannot be explained. However, as this only consisted of three articles of the 426 in total, a further investigation is not warranted.

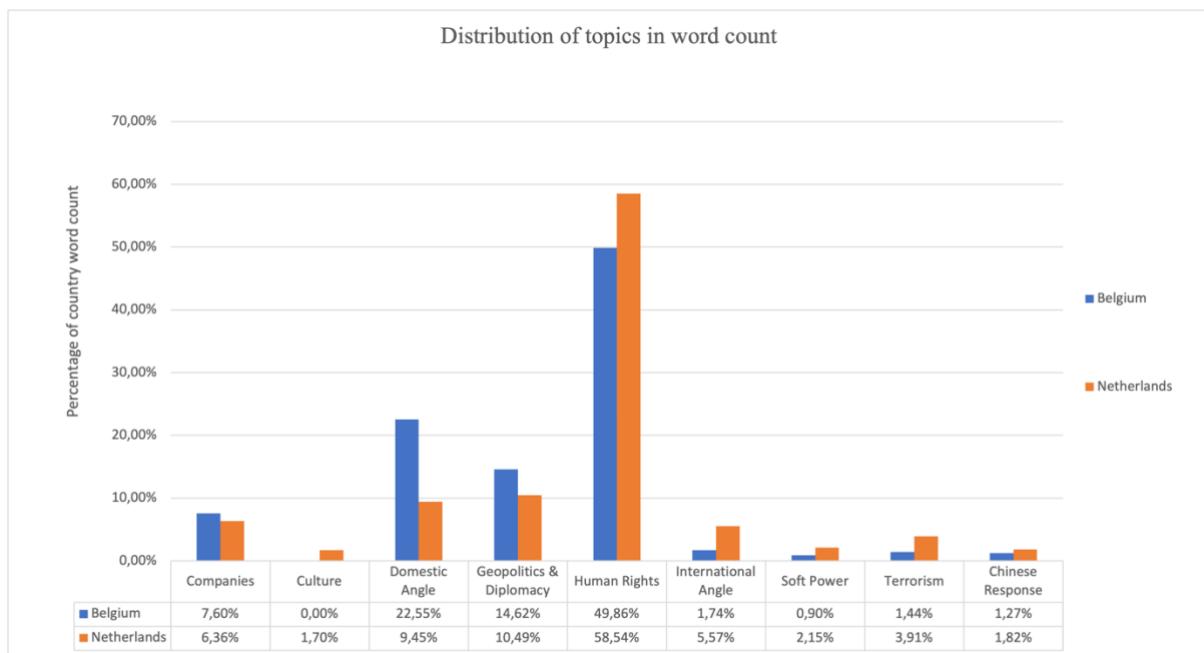

Figure 12: Distribution of topics in word count.

⁵ Articles: 16, 175, 403

If we instead look at the number of words dedicated to each topic we can see human rights is still the most written about topic and that its relative share is even higher than if we look at only individual articles (figure 12). It also appears that Dutch coverage seems to be slightly more spread out over topics as is the case with Belgian articles. The relative share of words dedicated to domestic articles in Belgium is also higher, reinforcing our previous finding that news appears to be more driven by domestic events in Belgian media than in the Netherlands. In the case of the latter, its relative share in word count was lower than in terms of individual articles, yet domestic issues remain the third most covered topic in the country's press.

Turning our analysis to individual newspapers, we can see some differences in coverage, although this, again, does not seem to be based on ownership or political stance (figure 13). For instance, *De Morgen*, *De Volkskrant* and *De Standaard* wrote a significantly higher share on the topic of politics than *NRC Handelsblad*, *Trouw* and *Le Soir*. However, one interesting aspect is that nearly one-third of all news coverage by *Le Soir* has been on domestic stories related to Uyghurs.

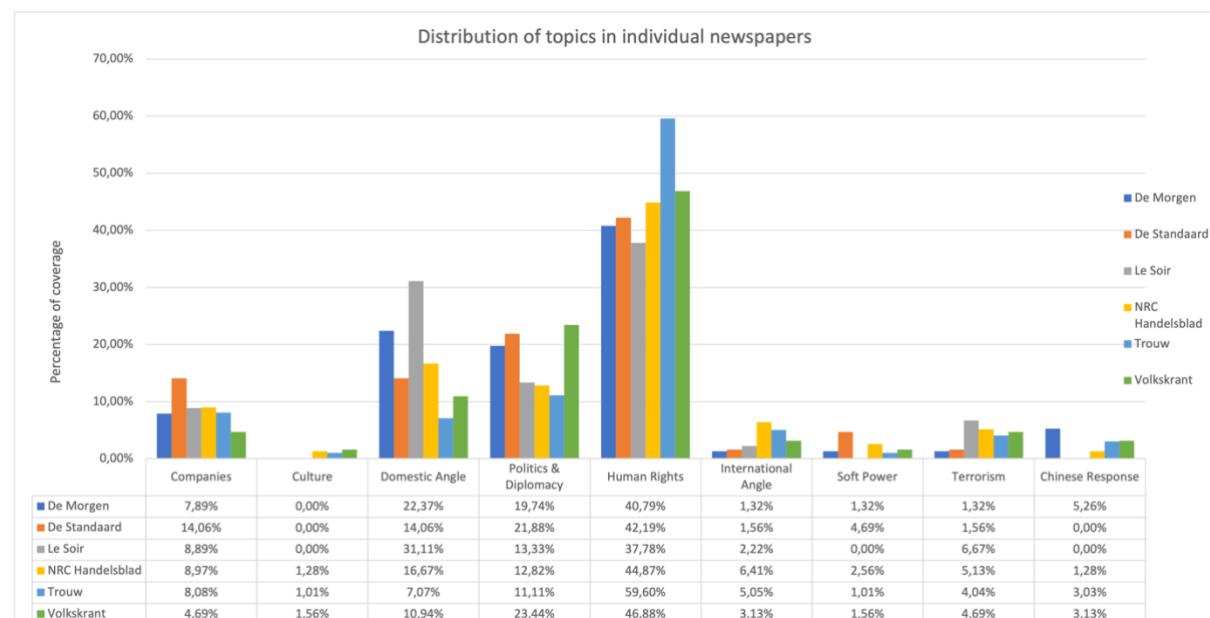

Figure 13: Distribution of topics in individual newspapers

Investigating the development of topic salience over time, the main finding is that we can observe a gradual downwards trend from 2018 onwards in terms of the relative share of the most salient topic that year, suggesting that coverage becomes more balanced in terms of subjects it discusses (table 4). Yet, human rights was the most salient topic by far in both countries between 2016 and 2020. The more balanced coverage in 2021 (and to a lesser extent 2020) can be explained by the growing infamy of Xinjiang, increased domestic and international concern and diplomatic conflict, which led to stories or events by themselves. An example can be the increased attention on the Belgian extreme left PTD/PVDA party given their refusal to vote for a resolution condemning the situation in Xinjiang and naming it a genocide⁶.

The analysis has thus far yielded interesting findings, appearing to support the hypotheses and expectations developed in this thesis that Dutch media would cover Uyghurs to a larger extent than Belgium media. Yet, what is even more interesting is that the investigation on article topics seem to suggest there are not only differences in how much Uyghurs are covered but also in what way they are covered. A subsequent assessment of two topics, domestic stories and articles related to politics and diplomacy, featured in the next sections of this chapter, indicates that Belgian news has been more driven by domestic events and international political events than was the case in Dutch media. Moreover, the last section will show that there even appear to be large differences between countries in how the situation in Xinjiang is assessed, by looking at the extent to which news outlets refer to the word “genocide” in their publications.

⁶ Article 350; 376; 331; 332.

Year	Belgium			Netherlands		
	Most salient topic	Share of total articles	Share of word count	Most salient topic	Share of total articles	Share of word count

5.3 Domestic News Coverage

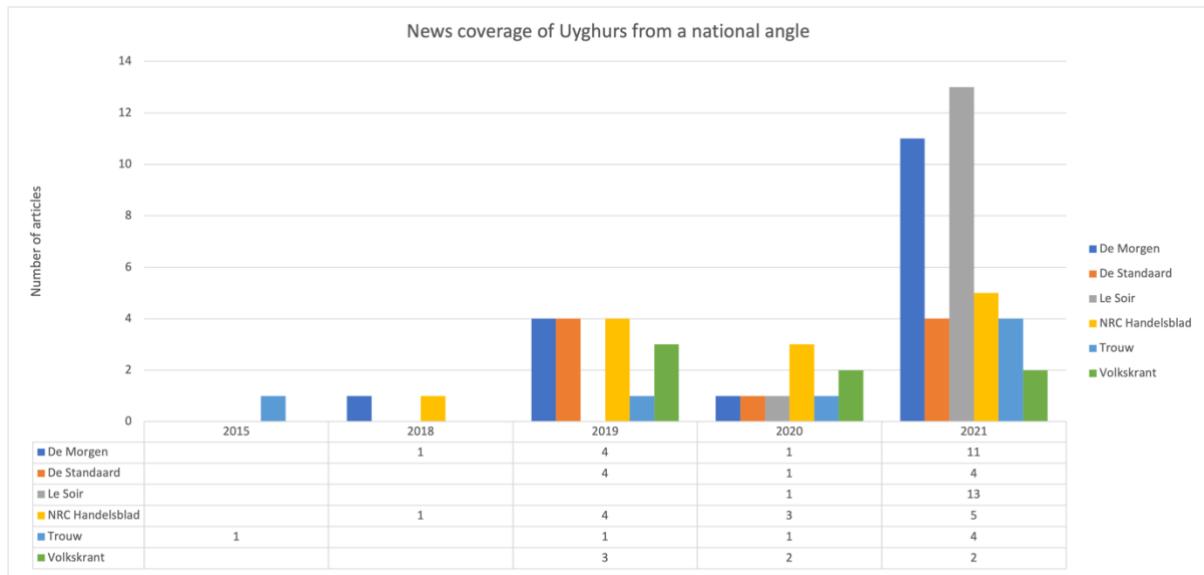

Figure 14: News coverage of Uyghurs from a national angle

We find that Belgian newspapers published more articles that covered Uyghurs from a national angle than Dutch newspapers did (figure 14). It can also be seen that coverage of Uyghurs which involves a domestic element only became substantial in 2019. *De Morgen* published the most articles (17) followed by *Le Soir* (14). Focusing on Belgian news coverage, we find that eight of the forty articles discussed a scandal in which the Belgian embassy in Beijing let a Uyghur woman get arrested after having requested family reunification with her husband who is a political asylum-seeker⁷. Interestingly enough, this story is completely absent in publications by *Le Soir*, even though they reported it on their website (Belga, 2019), suggesting that this was not considered an important enough topic to devote space in their newspaper to it. This story was also covered in the Netherlands by *De Volkskrant*⁸. The second most covered story (with seven articles), in this case published by all Belgian news outlets, was the debate and subsequent adoption of the resolution recognizing the risk of genocide in

⁷ Article 98; 101; 104; 112; 113; 120; 373; 377

⁸ Article 118

Xinjiang⁹. Another salient story was about an extradition treaty ratified by Belgium and China in 2021, and the concerns raised on how it might impact Uyghur refugees and dissidents. This was the main topic in four articles¹⁰. Whereas it is not the main focal point in any article published by *Le Soir*, the treaty has been mentioned three times in their articles on other topics¹¹. Other articles were about the supposed pro-China views by the political party PTB/PVDA and on the announcement of Chinese sanctions on a Belgian Member of the European Parliament.

We find that Dutch newspapers focused on stories involving export of knowledge and technology by both Dutch universities and companies to China, and how it had potentially helped in suppressing the Uyghur minority. Every newspaper published related stories, amounting to seven of the twenty-seven stories¹². Furthermore, we find a relatively high share dedicated to Dutch political responses (7), of which three were related to the Dutch Parliament's recognition of genocide¹³. Other articles were related to Uyghurs living in the Netherlands, covering stories relating to asylum policy, intimidation of refugees by the Chinese state and protests against the Uyghur genocide.

Despite the quite substantial share of coverage on domestic aspects regarding Uyghurs, it is the case that very few articles were featured at the front of the newspaper. Only three articles reached the front page, one from *De Morgen* and two from *Le Soir*, and only three Dutch news articles were published on the first three pages, as opposed to eight in Belgian newspapers (appendix 5). Again, these findings strengthen the view that domestic aspects related to Uyghurs have been the main drivers for Belgian newspaper editorials.

¹³ Article 130; 229; 242; 283; 285; 287; 413

5.4 Political News Coverage

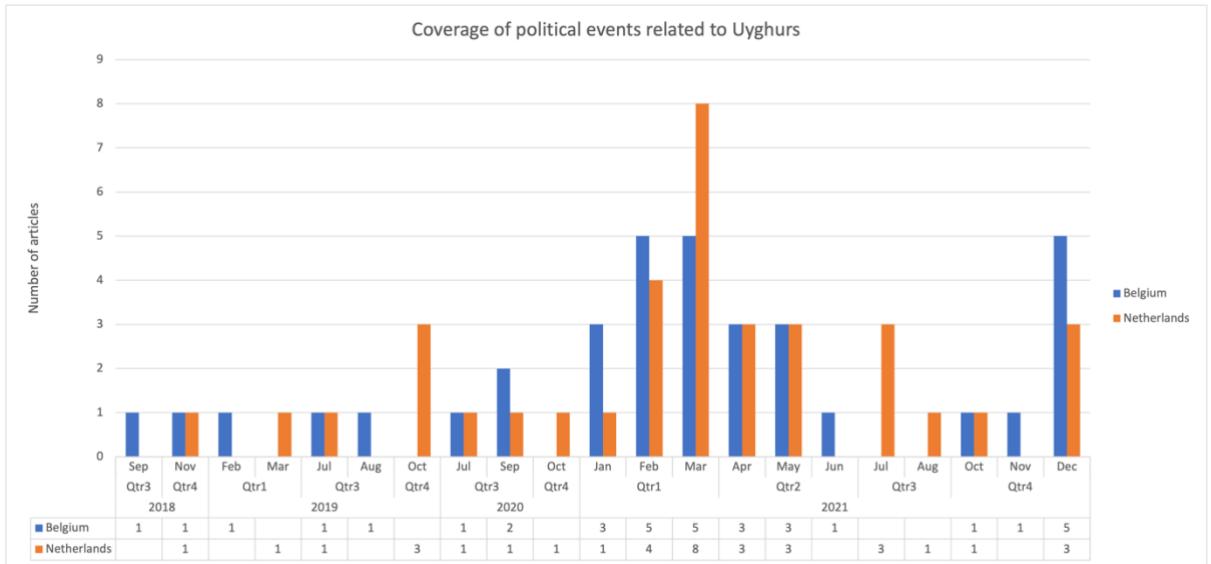

Figure 15: Coverage of political events related to Uyghurs

As was seen before, a substantial share of news coverage related to Uyghurs discussed political and diplomatic aspects of these human rights abuses. The Uyghur genocide has become an element in the much wider conflict between the West and China, and it has led to sanctions, condemnations from western leaders and it has been a prominent topic discussed during summits. Given that theory has established the high news value of international involvement (such as by the U.S and U.N), it comes as no surprise that there is very little variation in the extent of coverage between Belgium and the Netherlands (figure 15), both in articles produced as in word count (appendix 6). However, if we look more closely at which actors were the primary subject in the articles, we can see interesting discrepancies (figure 16).

First of all, we find that Belgian political news articles covered the EU to a very high extent. Again, this appears to support our expectations given that the most important EU institutions are in Brussels, and it thus seems that both eliteness of the EU as an actor and domestication complement each other. We also found that Dutch newspapers devoted

significantly more coverage to relations between China and the Taliban than Belgium did. However, this could be explained by the involvement of Dutch soldiers in combat missions in Afghanistan, which resulted in twenty-five losses, as opposed to the much smaller contribution of the Belgian military, and who have suffered no casualties in their mission. Furthermore, we can see that US involvement has a relatively high share of coverage in both Dutch and Belgian newspapers, fitting expectations. Interestingly enough, UN involvement has been covered substantially less in Belgium than in the Netherlands. This might be due to the fact that the International Court of Justice, a UN organ, is based in The Hague, which would confirm expectations set by domestication theory.

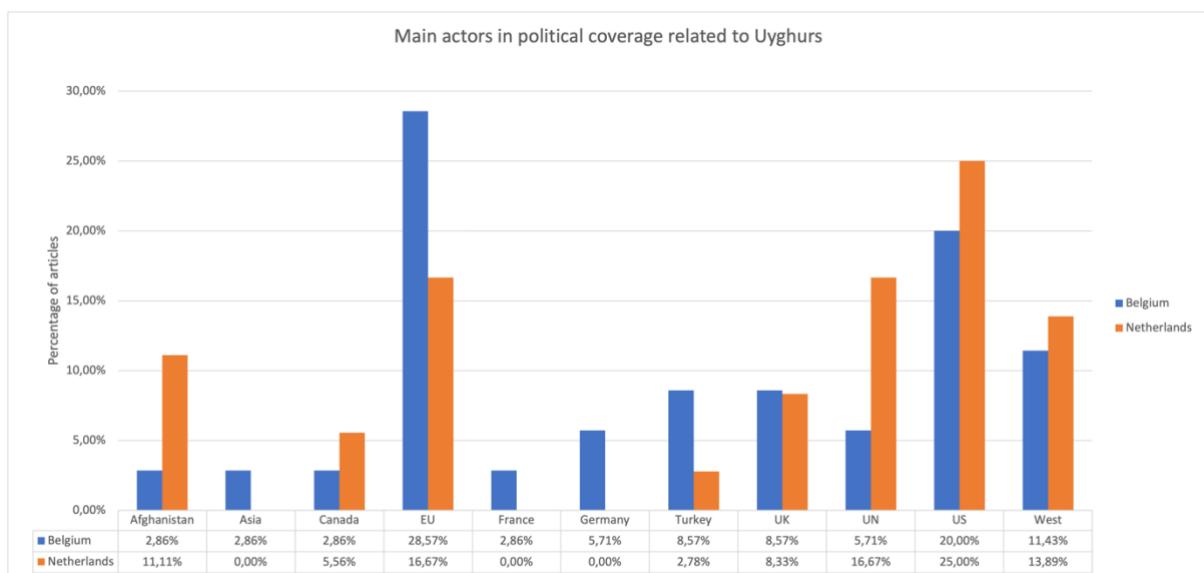

Figure 16: Main actors in political coverage related to Uyghurs

We also found a high discrepancy regarding individual newspapers (figure 17). *Le Soir's* coverage comprised of 50% on EU responses, followed by articles on the UN, US and the west in general (16,75% each). *De Standaard* features a high share of articles on Turkey and its relations with China, a topic which only *De Volkskrant* covered too. We find that *De Morgen* covered nearly every country/international organization/regional reference, with the

exception of Turkey. Lastly, we conducted a subsequent assessment of article placement. It revealed that Dutch newspapers placed these articles in a more prominent place than Belgian newspapers did. Yet, this appears to be mainly the case due to *NRC Handelsblad*, who has placed nearly 40% of these articles on the first two pages (Appendix 7).

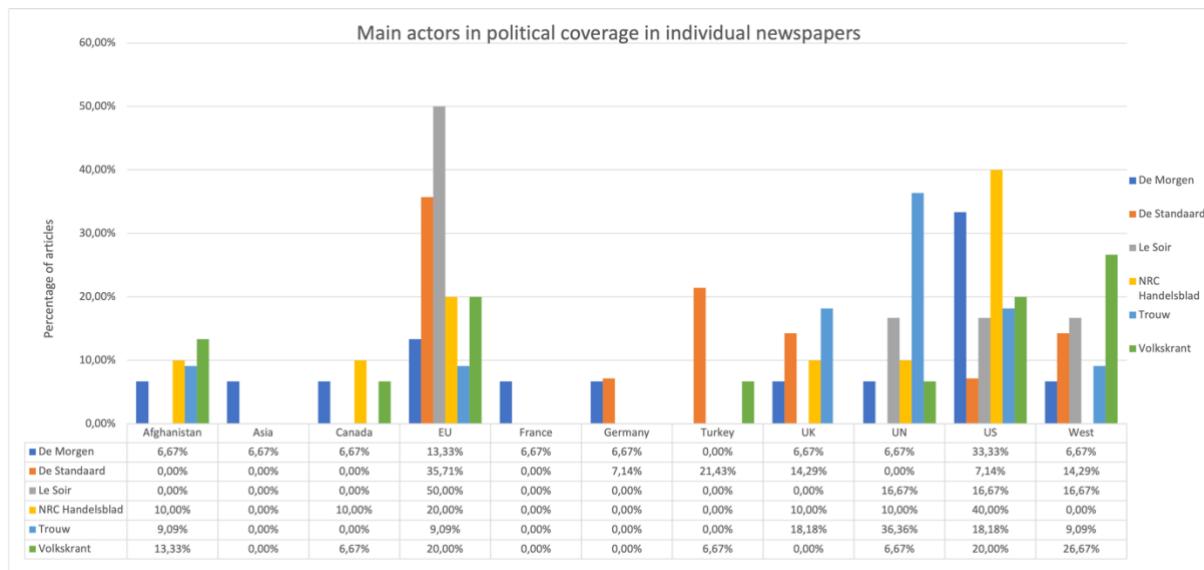

Figure 17: Main actors in political coverage in individual newspapers

5.5 References to Genocide in News Coverage

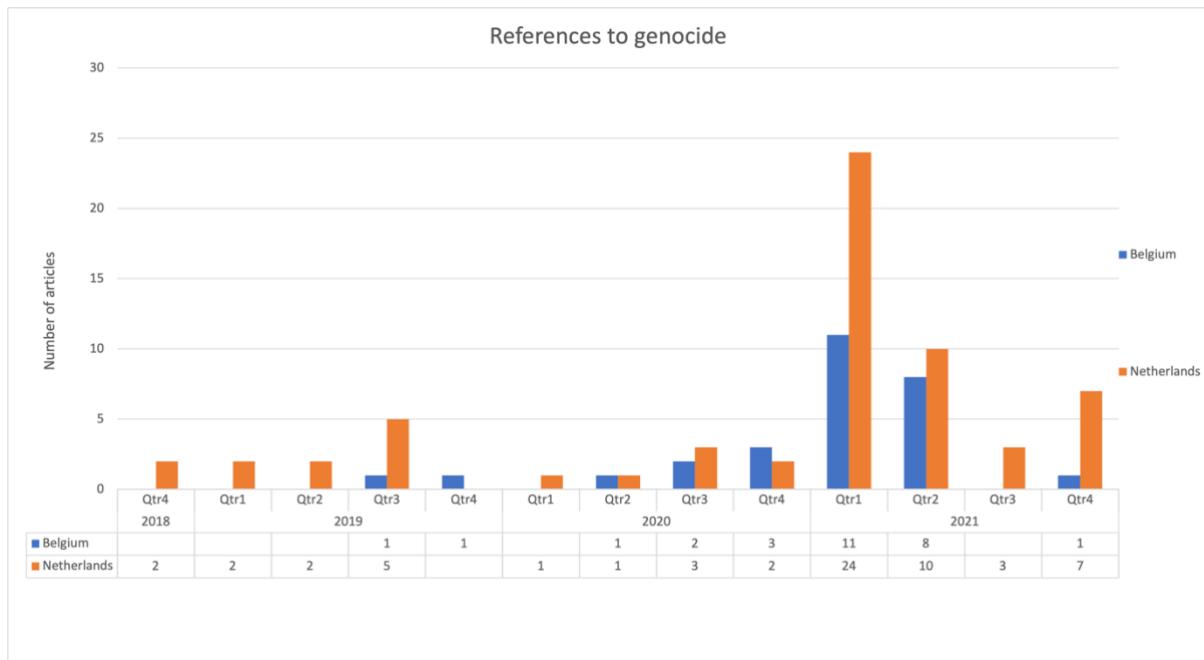

Figure 18: References to genocide

The analysis shows that Dutch newspaper have published significantly more articles in which genocide was referenced (figure 18). Of the 241 Dutch newspaper articles, 62 referenced genocide, a quarter of all Uyghur coverage. In contrast, only 28 of the 157 Belgian articles did so, amounting to only 15%. Furthermore, in each year, Dutch articles exceeded Belgian articles. Dutch articles also referenced genocide earlier, already in the last quarter of 2018, whereas Belgian newspapers only started referencing genocide in the second half of 2019. Moreover, Dutch newspapers have more consistently published articles, only missing one quarter in 2019 since it started referencing genocide. The last general finding is that no Belgian articles that referenced genocide were published on the front page, as opposed to the four articles published by *NRC Handelsblad* and *De Volkskrant*¹⁴.

¹⁴ Art 121; 291; 310; 369

If we focus on individual Dutch newspapers, we can see that *Trouw* has published not only the most articles referencing genocide, but it has also published in every quarter (except the last quarter in 2019). *NRC Handelsblad* published somewhat sporadically, featuring one article in 2018, four in 2019 to only start publishing a significant number of articles in 2021. *De Volkskrant* has published the least genocide-referenced articles and only started doing so in 2021. If we look at authorship of these publications, it was found that it was quite concentrated, as the two authors with the most publications referring genocide made up between 47% and 57% of all their newspaper's articles that referenced genocide. Another interesting element is that publications by the editorial (without a named author), made up a sizable proportion of this type of coverage, almost 20% in *Trouw* and nearly 15% in *de Volkskrant*.

If we look at Belgian papers (figure 19), the most striking result appears to be that *Le Soir* has only referenced genocide in only two articles, both published between April and June 2021. We can also see that news coverage by *De Morgen* features slightly more articles referring to genocide than *De Standaard*, with 15 to 11 articles respectively. If we look at the distribution, we can see that the latter paper published relatively more articles than the former in 2019 and 2020, although *De Morgen* has overtaken *De Standaard* in 2021. Focusing on authorship, we find that most articles referencing genocide were authored by the editorial in question (no published author), ranging from only 13% in *De Morgen* to 45% for *De Standaard*. However, each newspaper had just one journalist that published a significant share of the other publications referencing genocide. *De Standaard* has had just four authors, of which the most published one has written 26% of all genocide-referenced articles. In contrast, *De Morgen* has had ten different journalists reference genocide, although their most published journalist in this regard also makes up for 26% of all relevant articles. *Le Soir* featured only

two articles of which one was an editorial piece and the other published under a journalist's name¹⁵.

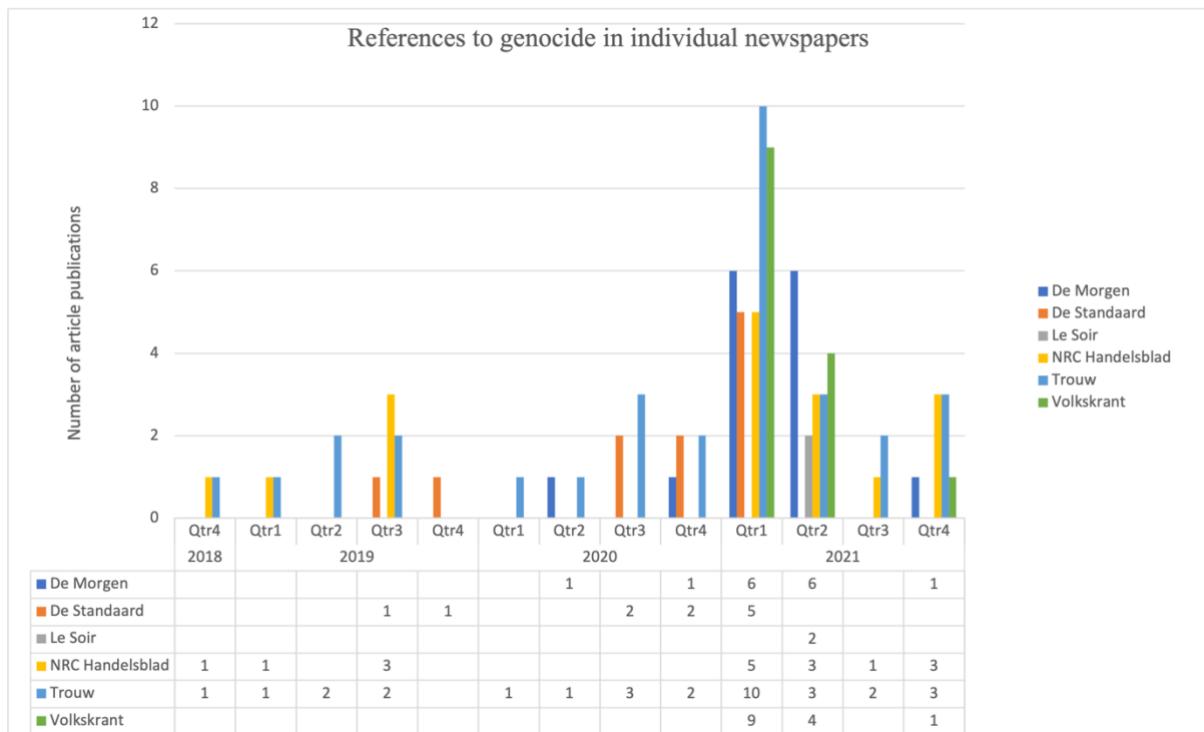

Figure 19: References to genocide in individual newspapers

Furthermore, following our assessment on which topics genocide was referenced, we find that most newspapers referenced genocide in articles focused specifically on human rights violations, such as in interviews with heads of NGOs¹⁶ or coverage due to a human rights report¹⁷ (figure 20). We also found that genocide was highly referenced in political coverage, which can be explained due to news on sanctions regarding the Uyghur genocide. An interesting finding is that we observed that genocide was more often referenced in coverage of domestic aspects in Belgium (nearly 30%) than was the case for Dutch newspapers (nearly 10%). We can also see that Dutch newspapers referenced genocide in every topic to some degree. A

¹⁵ Art 357; 356

¹⁶ E.g Art 457

¹⁷ E.g Art 339; 199

particularly noteworthy finding is that nearly 10% of all Dutch genocide references were placed in topics on companies. The six articles in total mainly discussed private company involvement in forced labour practices in Xinjiang¹⁸. This becomes even more relevant when we see that in the nineteen articles on companies in Belgian newspapers, the word genocide was never used.

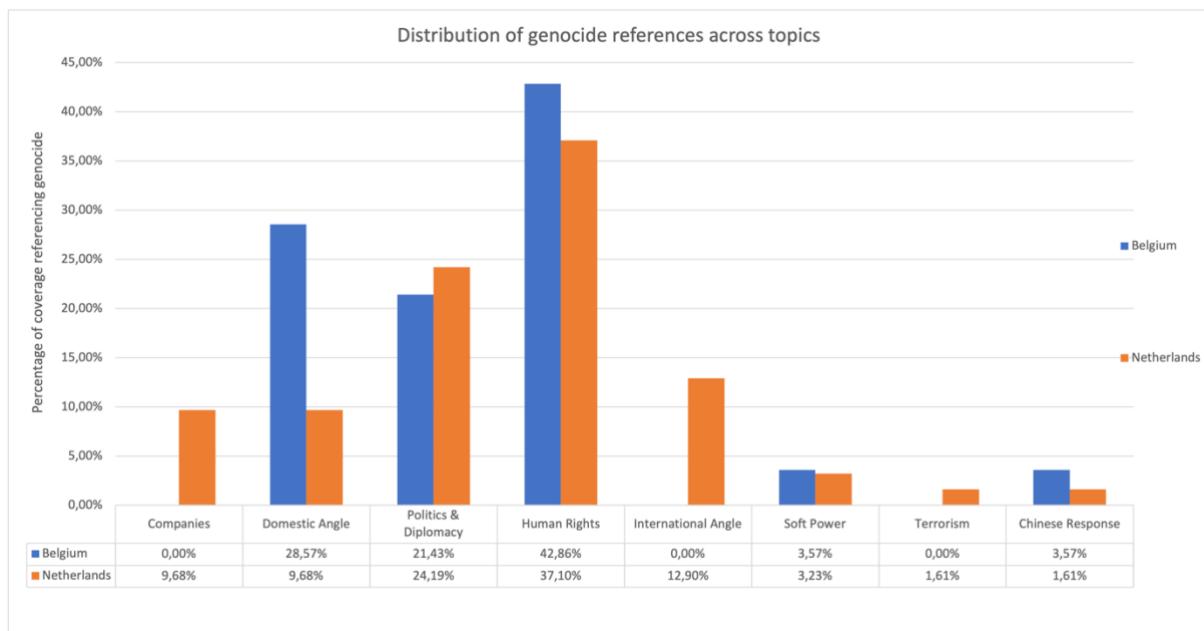

Figure 20: Distribution of genocide references across topics

Lastly, a look at individual newspapers reinforces the view that Belgian newspapers referenced genocide almost exclusively in human rights, politics and domestic topics, whereas Dutch newspapers referenced this in a broader range of topics (figure 21). *De Volkskrant* and *NRC Handelsblad* has had less than 30% of their mentions of genocide in articles on human rights, instead being featured in articles with an international angle to the Uyghur genocide (of which all were about Uyghurs in Turkey¹⁹) and political news. We find that *Trouw* has referenced genocide in nearly every topic except for the terrorism topic. Related to the latter

¹⁸ Art: 313; 324; 382; 398; 426

¹⁹ Art 79; 82; 85; 275; 291; 325; 369; 384

topic, it is interesting that even in an article on the threat of Uyghur terrorism by *De Volkskrant* the term genocide is mentioned in relation to Uyghurs²⁰. The broad use of the term genocide in Dutch newspapers suggests that the awareness or recognition of the fate of Uyghurs as a genocide is much more prevalent in the Netherlands as it is in Belgium.

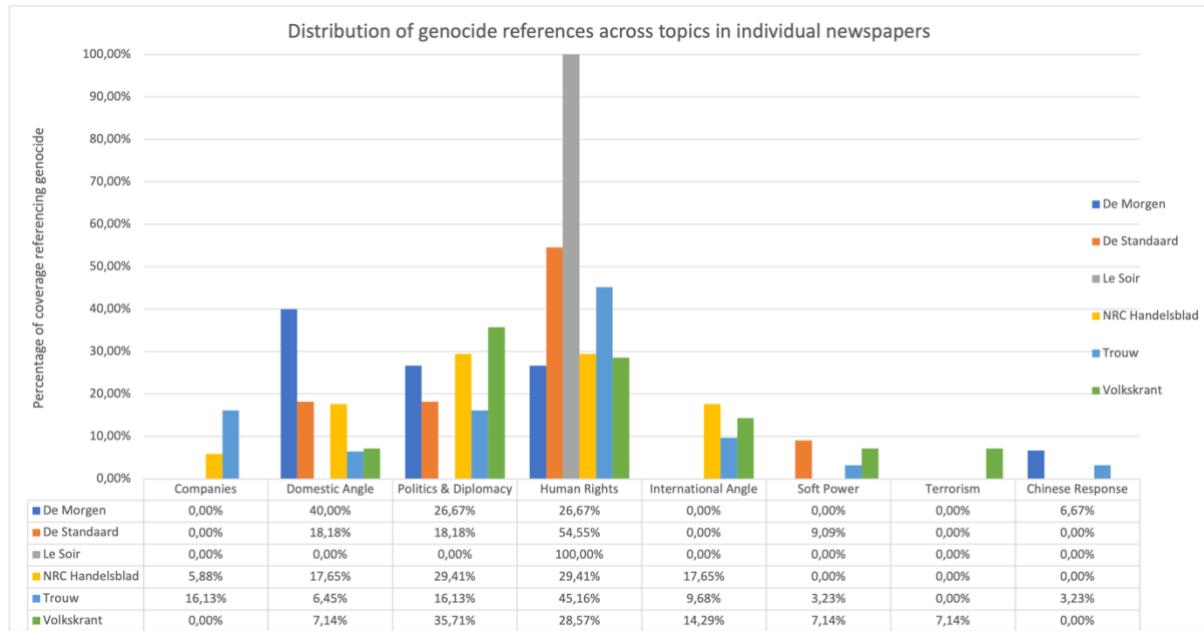

Figure 21: Distribution of genocide references across topics in individual newspapers

²⁰ Art 333

6. Discussion of Findings

The results outlined in the previous chapter thus appear to indicate with relative certainty that the extent of economic relations has a noticeable impact in how important foreign news events are considered by media outlets. Despite a common language, similar access to information, and even despite operating under the same parent company, there is a substantial difference in the extent of news reporting on Uyghurs between the Netherlands and Belgium. We find significant differences in the extent of individual publications and in word count, as well as in how prominently articles were featured within the newspaper. The fact that Dutch news coverage has been more consistent over time, and has started earlier, further strengthens the view that Uyghurs are higher on the agenda in the Netherlands than in Belgium. The findings therefore confirm H1, that stronger economic ties lead to more coverage of the Uyghur genocide, and H2, that stronger economic ties lead to earlier and more sustained coverage.

Moreover, the findings support general news value theory, given that events involving elite international actors like the US were given a high share of total coverage. In both countries, this was the second most published topic, and they also published nearly the same number of articles, which suggests that international political events relating to Uyghurs has had the same news value in both states. The reason why this topic featured a higher share in relation to total coverage in Belgium than in the Netherlands, is due to the fact that other topics appeared to have less news value for Belgium, leaving domestic and political news articles to represent more than a third of all Belgian coverage.

Furthermore, the analysis yields strong support for domestication theories, given that both Dutch and Belgian news coverage featured a high share of articles discussing domestic aspects related to Uyghur repression. The findings indicated that Belgian news coverage was more driven by these events than Dutch news coverage was, given that one-fifth of all Belgian

articles discussed stories related to domestic developments. Interestingly enough, support for domestication theory was also found looking at political news coverage, as we saw that both countries published more articles on international organizations which were (in part) based in their own country, such as the high share of articles on the EU in Belgium. This indicates that eliteness and domestication can complement each other. These results therefore confirm H3, that countries with weaker economic ties will cover the Uyghur genocide more through higher news-value stories involving international actors and/or domestic involvement.

What is perhaps the most striking finding is that many Dutch news articles named what is happening in Xinjiang a genocide, whereas this was featured to a far lesser extent in Belgian coverage. Not only did Dutch articles mention genocide much earlier, but they were also referenced in every topic related to Uyghurs. In contrast, most Belgian articles only mentioned genocide in news stories on domestic and international political actors who were either debating on or adopting a resolution specifically calling the situation a (risk of) genocide. This indicates that either Belgian newspaper authors did not see the situation in Xinjiang as a genocide to the same extent as their Dutch counterparts, or that the awareness of it is significantly lower.

This thesis finds no clear determinants of news coverage related to individual newspapers, suggesting that the ideological stance of the newspaper has no significant effect on coverage. The most surprising finding, namely the significantly lower extent of coverage by the francophone newspaper *Le Soir*, cannot be accounted for in the analysis or theory. Several options are possible, albeit that all remains mere conjecture and could only be thoroughly investigated in further research. The first, and most straightforward option, is that the coverage by Le Soir is just an anomaly in Belgian Francophone newspapers and that other newspapers, like *Le Libre Belgique*, feature the same extent of coverage than its Flemish counterpart. Secondly, a more speculative possibility is that Flemish news coverage is higher

than Francophone news due to the shared language with the Netherlands, which in combination with common ownership of newspapers leads to more interaction between Dutch and Flemish journalists, which in turn could spill over to how important the issue is considered as a news story. This could be investigated in further research.

7. Limitations

The theoretical framework and methodology used in this thesis were appropriate to investigate news coverage on Uyghurs in the Netherlands and Belgium. However, some limitations can be identified which should be considered in case of further research on the topic. First and foremost, feasibility requirements had the result that only one francophone newspaper could be analysed, as opposed to the two Dutch-language Belgian papers. This significantly reduced our ability to make robust claims on the difference between Walloon and Flemish newspapers. This was further problematized by the extremely low coverage of the French language paper chosen for the analysis, which also made it challenging to identify and justify trends in coverage. Secondly, feasibility has also limited the analysis to only two countries. Even though the case selection has been very robust, having selected two countries that are very similar but have a vastly different extent of economic relations with China, an expansion of cases would have benefitted the analysis to more precisely identify variables that influence news coverage of foreign human rights abuses.

8. Conclusion

This thesis has set out to investigate to what extent economic relations impact the newsworthiness of foreign human rights abuses in order to shed light on the specific determinants of news coverage on these issues. Whereas research has established that foreign human rights issues are generally under-reported in Western countries in favour of political and economic news, no enquiry has been launched on the question of what drives this coverage. Given that the literature has identified economic relations as being a strong predictor of general foreign news coverage, this thesis explored whether this also holds for news on foreign human rights abuses specifically. It has attempted to do so by investigating Dutch and Belgian news coverage on the Uyghur genocide between 2015 and 2021, given the varying extent of economic relations with China between those two countries. It was hypothesized that stronger economic relations would increase the news value of China, translating in more coverage on Uyghurs, and that coverage would be less driven by higher news value stories such as domestic involvement in the issue or involvement by important political actors.

Employing a qualitative content analysis, this thesis has collected all articles of six different newspapers on Uyghurs within the timeframe and has identified the main topic of those articles. It found that Dutch news coverage exceeded Belgian news coverage, that it was featured more prominently in newspapers, and that coverage was also more sustained over the timeframe. Moreover, a significant share of Belgian news coverage was driven by domestic developments or due to the involvement of international political actors like the U.S, implying that Belgian news coverage of the Uyghur genocide was not primarily driven by the existence and nature of these human rights abuses, but due domestic and international involvement. Furthermore, it found that Dutch newspapers published references to genocide both earlier and to a greater extent than its Belgian counterparts. These findings suggest that Dutch media's

interest and awareness of the issues in Xinjiang are far greater than in Belgium, and the argument can thus be made that China and subsequent news from China has a greater news value for the Netherlands. While further research involving other cases might expand our understanding of the precise mechanisms and specific elements of economic relations impacting human rights reporting, the results of this thesis suggest that the extent of economic ties is a strong predictor of coverage on human rights abuses.

Appendix 2: Coding Manual

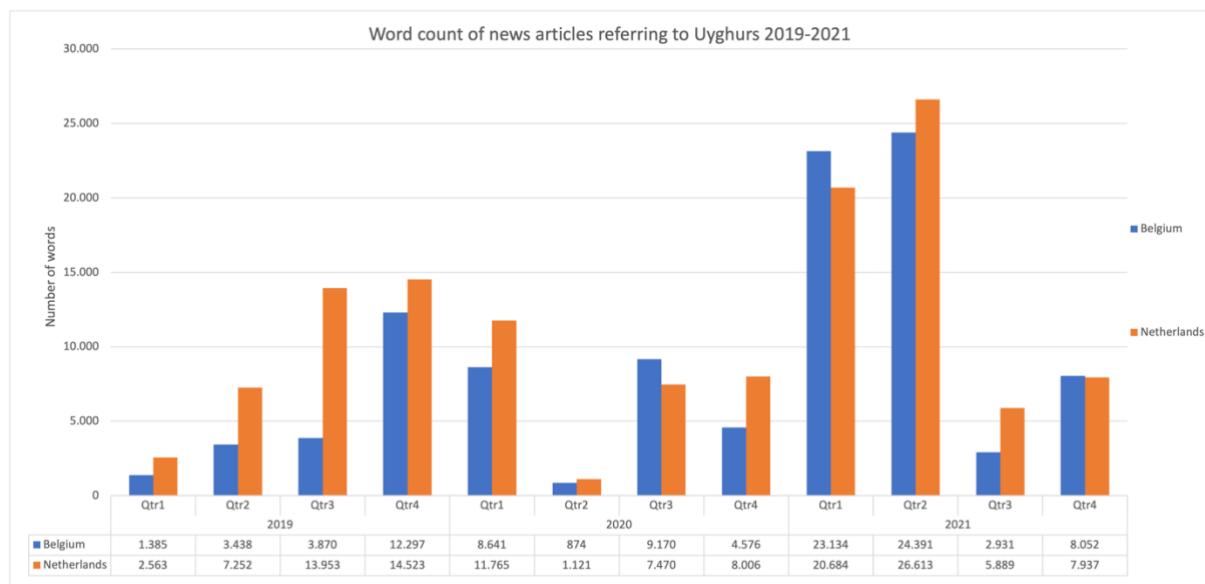

Code Number	Category	Content	Info
Basic Article Data			
1	Random Number	Eg: 1234	number to identify article.
2	Newspaper	Volkskrant, NRC, Parool, Trouw, De Morgen, De Standaard, Le Soir, Le Libre Belgique	
3	Country	Belgium, Netherlands	
4	Date of Publication	DD/MM/YYYY	
5	Author	Text	Full Name
6	Newpaper Section		
7	Word Count	Numerical	
Primary Data			
8	Newspaper Article Body	Text	Full article text retrieved from database
Content Analysis categories			
10	Chinese Response	Main focus of article on reactions by the Chinese Government	
11	Terrorism	Main focus of article on terrorists and terrorist attacks	
12	Culture	Main focus of article on Uyghur culture (traditions, music)	

13	Politics & Diplomacy	Focus of article on politics, summits, sanctions and boycotts.	Eg. Summits, sanctions, boycotts
14	Soft Power	Focus of article on Chinese influence and soft power	
15	Companies	Focus of article on specific companies	
16	Human rights	Focus of article on human rights abuses	e.g. internment, forced labour, surveillance and privacy.
17	Domestic Angle	Focus of article on domestic angle related to uyghurs	e.g. domestic protests, local political responses, local company involvement, response from domestic Uyghur diaspora
18	International Angle	Focus of article on Uyghurs in foreign countries (ex China)	e.g. Uyghurs in Turkey

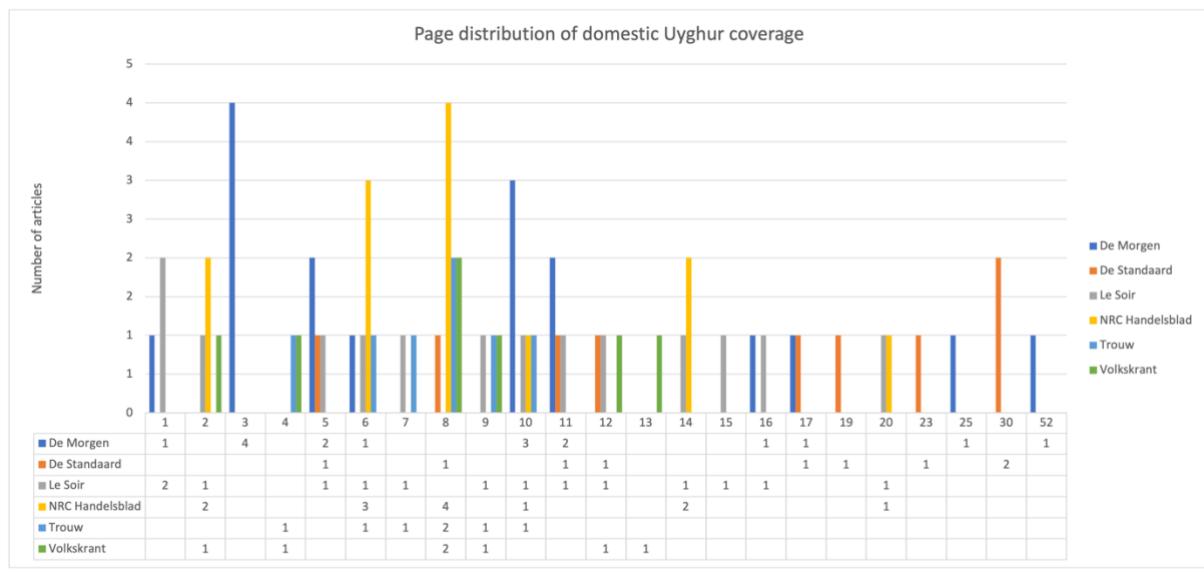

Appendix 3: screenshot confirming average word count per article in Dutch and Belgian newspapers

Column Labels 			
Be	NL	Grand Total	
Average of Words	601,9891892	678,6224066	645,342723

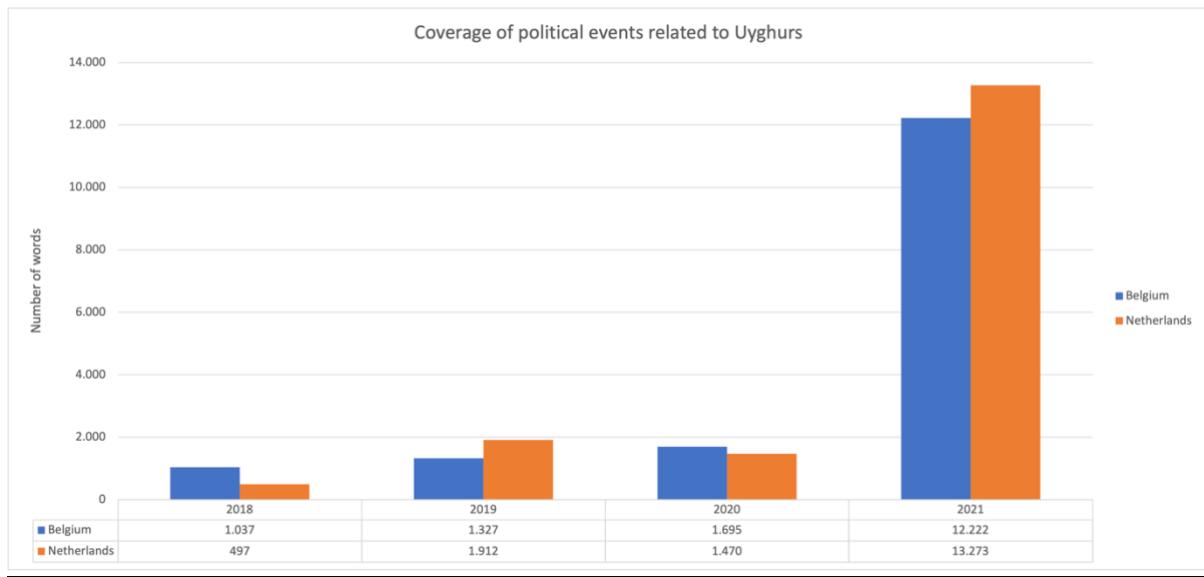

Appendix 4: Word count of news articles referring to Uyghurs 2019-2021

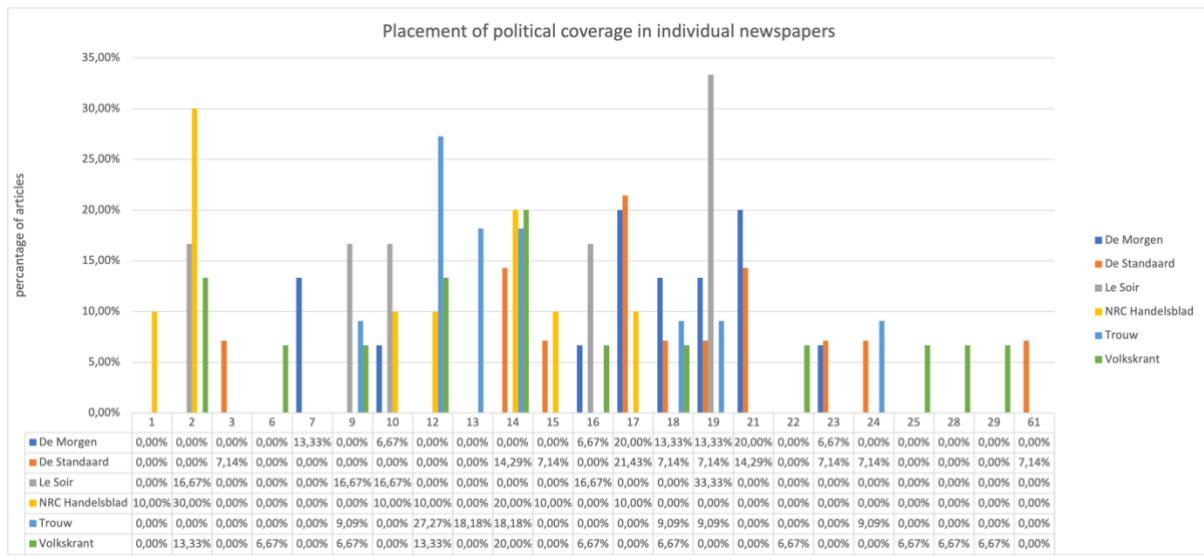

Appendix 5: Page distribution of domestic Uyghur coverage

Appendix 6: Coverage of political events related to Uyghurs in word count

Appendix 7: Placement of political coverage in individual newspapers

Appendix 8: Article Database (excluding text)
